Draft Facility-Wide Health Risk Assessment Report

City of Santa Clara (Facility # A0621)
560 Robert Avenue, Santa Clara, CA 95050

1. Executive Summary

This facility is a power plant owned and operated by the City of Santa Clara's Silicon Valley Power (SVP). It is a 7 megawatt (MW), natural gas-fired, combined-cycle cogeneration facility located in Santa Clara, California. The facility started operating in 1980 and currently includes two gas turbines and two duct burners. These sources emit toxic air contaminants (TACs) due to the combustion of natural gas. Based on the Air District's 2017 toxic emission inventory for this facility, the Air District determined that this facility was required to undergo a facility-wide health risk assessment (HRA) to assess the applicability of the Air District's Regulation 11, Rule 18 "Reduction of Risk from Air Toxic Emissions at Existing Facilities", or Rule 11-18.

The Air District conducted a facility-wide HRA for the City of Santa Clara's power plant based on the Air District's updated 2017 toxic emissions inventory for this site, the Air District's 2016 HRA Guidelines, and the Air District's 2019 HRA Modeling Protocol. The AERMOD air dispersion computer model was used to estimate maximum 1-hour and annual average ambient air concentrations. California Air Resources Board's Hotspots Analysis and Reporting Program Version 2 (HARP2) was used to evaluate health risks. Estimated health risks from the City of Santa Clara are summarized in Table 1.

Table 1. Summary of Health Risks from the City of Santa Clara

	Resident	Worker	Student	Maximally Exposed Individual (MEI)
Cancer Risk per Million	0.017	0.041	0.0028	**0.041**
Chronic Hazard Index	0.00025	0.0055	0.000089	**0.0055**
Acute Hazard Index	NA	NA	NA	**0.0088**

For the maximally exposed individual (MEI), this facility-wide HRA identified a maximum cancer risk of **0.041 in a million**, a maximum chronic hazard index of **0.0055,** and an acute hazard index of **0.0088**. As illustrated in Figure 1, each health impact from this facility is less than the final risk action level specified in Regulation 11-18-218.2.[1]

[1] The final RALs identified in Regulation 11-18-218.2 became effective on January 1, 2020. Since the Air District is publishing the draft HRA for the City of Santa Clara after January 1, 2020, the health risks for this site are being compared to the final RALs.

Figure 1. Comparison of Health Risks to Risk Action Levels

The Air District's preliminary conclusion is that the City of Santa Clara will not be required to meet the risk reduction requirements identified in Regulation 11-18-301 as all the estimated health risks from this facility are less than the Rule 11-18 RALs.

In accordance with Regulation 11-18-403, the facility was given 90 days to review and comment on this preliminary HRA. The Air District has made the necessary corrections to the HRA and is now making this draft HRA available for public review for a period of 45 days. The Air District will consider and respond to any comments received regarding this draft HRA before finalizing this HRA.

2. Purpose

The purpose of this facility-wide HRA is to determine if the Air District's Regulation 11, Rule 18 "Reduction of Risk from Air Toxic Emissions at Existing Facilities", or Rule 11-18, applies to this facility. Rule 11-18 requires existing facilities to reduce health risk if any of the facility's estimated health risks exceed a Rule 11-18 risk action level (RAL). The Rule 11-18 risk action levels are identified in Regulation 11-18-218 and are summarized below:

Table 2. Regulation 11-18-218 Risk Action Levels (RALs)

Health Risk Category	Final Risk Action Levels, Effective 1/1/2020
Cancer Risk	≥ 10 per million
Chronic Non-Cancer Hazard Index	≥ 1.0
Acute Non-Cancer Hazard Index	≥ 1.0

If a facility-wide estimated health risk level exceeds any of the three RALs, the facility must submit a Risk Reduction Plan (RRP) that demonstrates how this facility will either (a) reduce health risks below the final RALs, or (b) ensure that each significant source of risk is equipped with best available retrofit control technology for toxics, or TBARCT. If the facility-wide HRA demonstrates that Rule 11-18 applies, the HRA will also identify each significant source of health risk that could be subject to the rule's TBARCT requirements. The significant source thresholds and final health risk goals for Rule 11-18 are summarized below:

Table 3. Rule 11-18 Risk Reduction Goals

Health Risk Category	Significant Source Thresholds	Final Facility Wide Health Risk Goal
Cancer Risk	≥ 1.0 per million	< 10 per million
Chronic Non-Cancer Hazard Index	≥ 0.2	< 1.0
Acute Non-Cancer Hazard Index	≥ 0.2	< 1.0

3. Background

The City of Santa Clara's power plant (Air District Facility # A0621) has been operating at 560 Robert Avenue in Santa Clara, CA since 1980. The current facility includes two gas turbines and two duct burners that are fired exclusively by natural gas. These sources emit toxic air contaminants (TACs) due to the combustion of natural gas.

Exhaust gases from Gas Turbine S-1 are combined with those from Duct Burner S-3, and likewise, exhaust gases from Gas Turbine S-2 are combined with those from Duct Burner S-4, resulting in two sets of devices (e.g. S-1/S-3 and S-2/S-4). The emissions from the gas turbine and duct burner cannot be separated when determining compliance with individual emissions limits. In accordance with BAAQMD Regulation 1-107, such combined emissions shall be subject to the most stringent applicable limitations and requirements. Because of this determination, the applicable requirements for the Duct Burners are largely the same as those for the Gas Turbines. For the purposes of this HRA, each gas turbine/duct burner set will be treated as a single emissions unit.

The Air District uses a toxic emissions-based screening threshold called a "Prioritization Score" to determine if a facility needs to have an updated facility-wide HRA to assess Rule 11-18 applicability. Prioritization score calculation procedures are available on the Air District's web site.[2] For the purposes of determining Rule 11-18 HRA requirements, the Air District uses a proximity adjustment factor of 1.0 for all prioritization score calculations.

Based on the Air District's updated 2017 toxic emission inventory for this facility, the prioritization scores were 36.11 for cancer risk and 2.48 for chronic non-cancer. Under Phase II of the Air District's Rule 11-18 Implementation Procedures,[3] any facility with a prioritization score greater than 10 for cancer risk and less than 250 or greater than 1.0 for chronic non-cancer is required to have a facility-wide HRA conducted in accordance with the Air District's 2016 HRA Guidelines.[4] Since the updated prioritization scores for the City of Santa Clara exceed the thresholds, this facility is required to undergo a facility-wide HRA to assess Rule 11-18 applicability.

4. Source List and Source Emissions

The cogeneration plant of the City of Santa Clara has two turbines and two burners. The capacities and 2017 throughput rates are summarized below.

Table 4. Turbines and Duct Burners – Capacities and 2017 Throughput Rates

	Maximum Permitted Capacity		2017 Throughput Rates
Source	Turbine and Burner	Natural gas (MM BTU/hour)	Natural gas (MM BTU/year)
S-1 turbine	S-1/S-3 combined	75.48	436,060
S-3 duct burner			
S-2 turbine	S-2/S-4 combined	75.48	391,231
S-4 duct burner			

The Air District updated the annual toxic emissions inventory for this facility based on natural gas usage data reported by the facility for 2017 and Air-District approved toxic emission factors. For calendar year 2017, the facility reported using 427,507,228 standard cubic feet (scf) of natural gas at S-1/S-3 and 383,564,042 scf of natural gas at S-2/S-4. The maximum permitted level for each turbine is 589 million (MM) scf per year. The 2017 throughput levels for sources S-1/S-3 and sources S-2/S-4 are approximately 73% and 65% of the maximum permitted levels for each

[4] http://www.baaqmd.gov/~/media/files/planning-and-research/permit-modeling/hra_guidelines_12_7_2016_clean-pdf.pdf?la=en

turbine. Both the 2018 and 2019 throughputs were slightly lower than the 2017 throughput levels that were used in this report.

These usage rates are equivalent to 436,060 MM BTU/year for S-1/S-3 and 391,231 MM BTU/year for sources S-2/S-4. The toxic emission factors are based on source test data for benzene and formaldehyde[5] and the Air District's default emission factors for gas turbines for all other TACs.

The Air District created a maximum 1-hour emissions inventory for this facility based on the maximum combustion capacity of each gas turbine/duct burner emissions unit (75 MM BTU/hour) and Air District approved toxic emission factors. Source test-based emission factors were used for benzene and formaldehyde[5] and Air District default emission factors were used for all other TACs.

The facility-wide TAC emissions inventory is summarized below for each emissions point.

Table 5. 2017 Emission Inventory for Facility # A0621, City of Santa Clara

POLLUTANT – TAC	S-1 / S-3		S-2 / S-4	
	Lbm/Year	Lbm/Hour	Lbm/Year	Lbm/Hour

[5] A source test was conducted by BAAQMD at Facility A0621 on October 25, 2018. The source test included testing for exhaust flow rate, benzene concentration, and formaldehyde concentration on each gas turbine/duct burner stack. The testing included three 1-hour runs for each stack. The average results for each stack were used to develop the benzene and formaldehyde emission factors for each gas turbine/duct burner set that were used for the annual emission inventory. The maximum benzene and formaldehyde emission factors determined for any 1-hour run at either stack was used to create the maximum 1-hour inventory.

POLLUTANT – TAC	S-1 / S-3		S-2 / S-4	
	Lbm/Year	Lbm/Hour	Lbm/Year	Lbm/Hour
NICKEL [3]	8.20E-02	1.42E-05	7.36E-02	1.42E-05

XYLENES (mixed isomers)	1.12E+01	1.93E-03	1.00E+01	1.93E-03

1 The emission factor reference indicates that this compound was not detected (ND) during source testing. In accordance with Air District conventions, the emission factor used for this inventory is calculated based on ½ of the detection limit-based emission factor.

2 Emission rates were derived from an October 2018 source test on these sources at this facility.

3 Emission rates were derived from BAAQMD source tests conducted in December 2019 on natural gas fired turbines.

Except for benzene and formaldehyde, TAC emission factors (EFs) for all other compounds are based on Air District default TAC EFs for gas turbines.[6] Air District default emission factors (EFs) for TACs emitted from cogeneration plants are determined using Environmental Protection Agency (EPA) AP-42 Compilation of Air Emission Factors, fifth edition, Chapter 3.1, and CARB's California Air Toxic Emission Factors (CATEF) database[7], BAAQMD Permit Handbook Chapter 2.41 Micro Turbines[8], and BAAQMD source test data. As noted in Table 6, the Air District used 50% (or one-half) of the detection limit to calculate the emission factor when a compound was identified as non-detect for the source test on which the reported emission factor was based.

The benzene and formaldehyde EFs are based on Air District source testing conducted at both turbines on October 25, 2018. According to BAAQMD TAC Emission Factor Guidelines, site specific data is preferred to default factors. Therefore, both benzene and formaldehyde emission factors are derived from this site-specific source test. The average benzene and formaldehyde emission factor from the three test runs were used for annual emission calculations, while the highest (1-hour) sampling data from the three test runs was used as maximum 1-hour emission calculations for Regulation 11-18 facility wide HRA.

XYLENES (mixed isomers)	1330-20-7	2.56E-05	CATEF FACTOR - NATURAL GAS [5]

1 Conversions from lbs/MM scf to lbs/MM BTU used a natural gas heat content of 1020 BTU/scf (HHV).

2 BAAQMD Source Test # 20105 and # 20121 were conducted on a gas turbine and heat recovery steam generator fired on natural gas during December 10-12, 2019. Although the tested units were equipped with SCR and oxidation catalyst controls, these add-on controls are not expected to impact emission rates for particulate TACs. Therefore, the metal emission factors derived from these source tests are representative of both controlled and uncontrolled natural gas fired turbines.

3 The emission factor reference indicates that this compound was not detected (ND) during source testing. In accordance with Air District conventions, the emission factor used for this inventory is calculated based on ½ of the detection limit-based emission factor. In some cases, the emission factor reference also used this ½ detection limit convention and reported the emission factor as ½ of the detection limit-based emission factor. Air District staffed reviewed the basis of each detection limit-based emission factor to ensure that this convention was applied to the reported factor only if the reported factor did not already include this convention.

4 Acronyms:

BTU	British Thermal Unit
HHV	high heating value
LBM	pounds
MM	million
ND	not detected
NP	value not provided
SCF	standard cubic feet

5 Although the emission factor from AP-42 Chapter 3.1-3 was higher than the CATEF emission factor for that pollutant, the Air District chose the CATEF factor as the default factor. In accordance with Air District TAC Emission Factor Guidelines, CATEF data is preferred over AP-42 data.

5. Air Dispersion Modeling

The AERMOD air dispersion computer model (Version 19191) was used to estimate annual average and maximum 1-hour ambient air concentrations. Model runs were made with 5 years of San Jose International Airport (KSJC) meteorological data (2013-2017). This AERMET data includes an adjustment for surface friction (u*) that improves model performance at low wind speeds. The new AERMET sets were prepared by BAAQMD meteorology staff. Upper air data coincident with the local meteorological data was taken from the Oakland International Airport station. Land use parameters including surface roughness length, albedo, and Bowen ratio were evaluated using the EPA AERSURFACE tool.

Dispersion coefficients for air dispersion modeling were selected based on the land use classification scheme proposed by Auer (Auer, 1978)[9]. The classification determination involves assessing land use by Auer's categories within a 3-km radius of the facility site. EPA's AERSURFACE tool (version 13016) with United States Geological Survey (USGS) National Land Cover Data (NLCD92) was used to summarize the land use classifications within a 3-km radius of the facility[10]. The land use was determined to be urban, because Auer Rural land use categories made up 41% of the total area (Urban was 59%). Therefore, the AERMOD runs were made with urban dispersion coefficients.

The model is referenced in North American Datum of 1983 (NAD 83) Universal Transverse Mercator (UTM) coordinates and uses 10-meter resolution terrain data from Santa Clara East and Santa Clara West Counties and 1/3 arc second National Elevation Dataset (NED) files. The KSJC meteorological site is located a little more than 1 mile southeast of the facility and appears to the most representative meteorological data available for the modeled area based on elevation, surface characteristics, wind direction, and wind speed.

Stack and building parameters for the analysis were based on information provided by the facility and summarized in Table 7. All modeled sources are open, vertical oriented exhaust stack outlets (point sources). Regulatory default options were selected, consistent with established practices for use of AERMOD in regulatory applications. In addition, since the sources operate continuously, no scalars were applied to each modeled source

Receptor networks were constructed for the dispersion analysis including a fine grid containing receptors spaced 20 meters apart extending 400 meters from the sources, and a rectangular grid containing receptors spaced 20 meters apart extending 500 meters in the Y direction and 800 meters in the X direction. The rectangular grid represents the residential receptors. The grid receptor locations inside of the facility boundary are not included in the HRA. All receptors were modeled with a flagpole height of 1.5 meters to approximate an average human breathing zone. A total of 2630 receptors were included in the analysis. Since the point of maximum impact (PMI)

[9] Auer, Jr., A.H. (1978). Correlation of Land Use and Cover with Meteorological Anomalies. Journal of Applied Meteorology, 17(5), 636-643.

[10] See Appendix A of the BAAQMD Health Risk Assessment Modeling Protocol: https://www.baaqmd.gov/community-health/facility-risk-reduction-program

was located in the street, where no actual receptors are expected, additional discrete receptors (21 receptors) were added along the property line to clarify impacts for actual receptor locations.

Table 7. Point Source Release Parameters

Point Sources	Exhaust Direction	Outlet Type	Stack Height (above ground level)	Exit Diameter	Cross Sectional Area	Typical Exhaust Gas Flow Rate	Typical Exhaust Temperature
	Vertical or Horizontal	Rain Cap or Open (or Hinged Rain Flap)	(ft)	(ft)	ft^2	(Actual, wet cfm)	(degrees F)
S-1 & S-3	Vertical	Open	50	5.64	25	36,646	282
S-2 & S-4	Vertical	Open	50	5.64	25	26,646	282

6. HARP2 Risk Assessment

The HARP2 Air Dispersion Modeling and Risk Tool (ADMRT) was used to evaluate health risk in the following categories: (1) Cancer Risk and (2) Chronic Hazard Index for Residential, Off-site Worker and Student receptors; and (3) Acute Hazard Index for the maximally exposed individual (MEI).

- Individual cancer risk is the increased chance for a person to contract cancer after long-term exposure to facility emissions (for example, 30 years for a resident and 25 years for a worker).
- The chronic hazard index is a ratio of annual average concentrations of TACs in the air to established chronic reference exposure levels (RELs). A chronic hazard index below 1.0 indicates that adverse non-cancer health effects from long-term exposure are not expected.
- The acute hazard index is a ratio of maximum 1-hour average concentrations of TACs in the air to established acute RELs. An acute hazard index below 1.0 indicates that adverse non-cancer health effects from infrequent short-term exposure are not expected.

Chronic exposure assumptions assume that TAC emissions are continuous and that pollutant concentrations are annual average values. Acute exposure assumes a maximum hourly emission rate. Dispersion modeling for the ADMRT is based on unit emission rates of 1.0 grams per second for each source (or combined source) and determines 1-hour and annual average unit concentrations in micrograms per cubic meter, per gram per second (X/Q). Health risk estimates were calculated in accordance with the BAAQMD's Air Toxics NSR Program HRA Guidelines, dated December 2016. Since the facility's TAC emissions include multi-pathway pollutants (arsenic, beryllium, cadmium, chromium VI, lead, mercury, nickel, PAHs), several non-inhalation exposure pathways were also included in the HRA, including dermal adsorption, soil ingestion, and mother's milk ingestion. Though the gas turbines and duct burners have no controls (e.g., no particulate emission control devices), these sources are considered to be controlled sources because internal combustion engines powered by compressed natural gas emit particulate matter less than

2.5 microns. Therefore, a deposition rate of 0.02 meters per second was chosen when determining multi-pathway health impacts.

Residential Receptors:

Estimates of residential risk assume potential exposure to annual average TAC concentrations occur 350 days per year, for 30 years. In addition, residential risk estimates assume a 95th percentile breathing rate, for age groups younger than two years old, and 80th percentile breathing rate, for age groups that are older than or equal to two years of age.

Residential cancer risk estimates include age sensitivity factors (ASFs) and fraction of time at home (FAH) adjustments. The ASFs are age-specific weighting factors used in calculating cancer risks from exposures of infants, children and adolescents, to reflect their anticipated special sensitivity to carcinogens. For risk assessment of residential receptors, FAH (73%) was applied to age groups greater than or equal to 16 years, per BAAQMD's policy.

Worker Receptors:

Risk estimates for offsite workers assume potential exposure occurs 8 hours per day, 250 days per year, for 25 years. For offsite workers, the 95th percentile 8-hour breathing rate based on moderate activity was assumed. Continuous operation is assumed for this facility; no worker adjustment factor was applied to off-site worker cancer risk estimates.

Student Receptors:

For children ages 2 up to 16 years at schools and daycare facilities outside of the home, risk estimates assume potential exposure occurs 10 hours per day, 180 days per year, for 9 years. The 95th percentile 8-hour breathing rate based on moderate activity (for age group: 2<16 years; 520 L/kg-8 hours) was assumed for all students.

Receptor-specific exposure assumptions are summarized in Table 8.

Table 8. Exposure Assumptions by Receptor Type

Receptor Type	Exposure Frequency and Duration			Intake Rate % Breathing Rate Category		Exposed Person's Age Range
	Days per Year	Hours per Day	Years			
Residential	350	24	30	RMP using the Derived Method	95th percentile for age groups < 2 years, and 80th percentile for age groups ≥ 2 years	> 3rd Trimester
Worker	250	8	25	OEHHA Derived Method	8-hr breathing rate with moderate intensity	> 16 years
Student	180	10	9	95th percentile high end	8-hr breathing rate with moderate intensity	< 16 years

7. Summary of Results

The estimated facility-wide health risks resulting from stationary source operations at the City of Santa Clara are summarized in Table 9 below. At the MEI locations for each health risk category, the maximum estimated health risks are: 0.041 in a million for cancer risk, 0.0055 for chronic hazard index, and 0.0088 for acute hazard index. Chromium VI[11] and cadmium[11] are the major contributors to cancer risk for residential and worker receptors. Mercury[11] and arsenic[11] are the major contributor to chronic hazard index for all receptors. Acrolein[12] and formaldehyde are the major contributors to the acute hazard index, where the identified target organ system of concern is the eye system.

Table 9. Health Risks from Facility # A0621 at 2017 Throughput Level

Receptor (1)	NAD 83 UTM Coordinates (meters)		Cancer Risk (in a million)	Chronic HI	Max Acute HI (1-hour)
	Easting (x)	Northing (y)			
Resident	593,026	4,135,684	0.017	0.00025	NA
Worker	593,646	4,135,704	**0.041**	**0.0055**	NA
Student-Scott Lane Elementary School	592,161	4,135,201	0.0028	0.000089	NA
Acute MEI	593,756	4,135,770	NA	NA	**0.0088**

(1) The health risk contour maps in Appendix C show the health risks at *potential* receptor locations near this facility. For each type of health risk, the point of maximum impact, or PMI, occurs along the fence line of the facility next to a road. However, the health risks at the PMI and at other fence line locations occur in areas where there are no *actual* receptors, or exposed individuals (EI), as defined in Regulation 11-18-208. The results reported in Table 9 reflect locations where there is an *actual* EI. The health risk values in bold text are the maximum values.

The Air District compared the facility-wide estimated health risks from Table 9 to the final RALs identified in Table 2. Maximum cancer risk, chronic hazard index, and acute hazard index were each below the applicable final RAL for that health risk category. Detailed results of this comparison are presented below.

[11] Chromium VI, cadmium, mercury, and arsenic were determined using BAAQMD source tests #20105 and #20121. Arsenic emissions are based on detection limits rather than measured data. Since cancer risk and chronic hazard index were both far below the significant source thresholds, no further refinements of these health impacts were necessary.

[12] Acrolein was determined using CATEF emission factors for gas turbines fired on natural gas. Due to problems with the acrolein test method, the Air District typically does not include acrolein contributions in the final risk results. However, this refinement was not made here, because the total acute impact is far below the risk action level.

Table 10: Pollutant Risk Contributions at Highest Receptor

Risk Category	Risk Value	NAD 83 UTM Coordinates (meters)		Risk Driver 1	%	Risk Driver 2	%
Cancer Risk in a Million	**0.041**	593,646	4,135,704	Chromium Vl	45%	Cadmium	13%
Chronic Hazard Index (CNS)	**0.0055**	593,646	4,135,704	Mercury	64%	Arsenic	26%
Acute Hazard Index (EYE)	**0.0088**	593,756	4,135,770	Acrolein	53%	Formaldehyde	45%

Table 11 summarizes the maximum source risks for each turbine and duct burner combination (S-1/S-3 and S-2/S-4.) As shown in Table 11, for nearby receptors, the estimated cancer risk for each turbine/duct burner source group was 0.02 in a million. The estimated chronic hazard index for each source group was 0.0027 and 0.0028 for worker receptors. The estimated acute hazard index for each source group was 0.0059 to 0.0029. Each source group (S-1/S-3 and S-2/S-4) is not considered to be a significant source of health risk, as no health risk category for each source group exceeds a significant source threshold. No further action is required, because facility-wide health risks do not exceed a RAL.

Table 11. Maximum Source Risks for Each Gas Turbine/Duct Burner

	Source Risks for S-1/S-3	Source Risks for S-2/S-4	Significant Source Thresholds
Cancer Risk per Million	0.02	0.02	1.0
Chronic HI	0.0027	0.0028	0.2
Acute HI	0.0059	0.0029	0.2

8. Preliminary Conclusions

This facility-wide HRA results in estimated health risks for the maximally exposed individual, or MEI, of: a cancer risk of **0.041 in a million**, a chronic hazard index of **0.0055**, and an acute hazard index of **0.0088**. The facility-wide cancer risk, chronic hazard index, and the acute hazard index are each below the final RALs that became effective on January 1, 2020.

In accordance with Regulation 11-18-403, the Air District has provided a preliminary HRA to the facility. The facility provided comments, and the Air District revised the HRA in response to these comments.

The Air-District is ready to publish a draft HRA for public comment. The public will have 45 days to review and comment on the draft HRA. The Air District will consider and respond to all public comments before making a final decision on this HRA.

The Air District's preliminary conclusion is that the City of Santa Clara will not be subject to the risk reduction requirements of Regulation 11-18 for the SVP facility. The Risk Reduction Plan (RRP) requirements identified in Regulation 11-18-301 will not apply, and no further action is required.

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
**Model Uses NO WET DEPLETION.  WETDPLT  =  F
```

```
**Model Uses URBAN Dispersion Algorithm for the SBL for     2 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   1952872.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

**Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of:  OTHER

**Model Calculates  1 Short Term Average(s) of:   1-HR
    and Calculates PERIOD Averages

**This Run Includes:      2 Source(s);       2 Source Group(s); and    2651 Receptor(s)

               with:      2 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                and:      0 VOLUME source(s)
                and:      0 AREA type source(s)
                and:      0 LINE source(s)
                and:      0 RLINE/RLINEXT source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with      0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date:  18081

**Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**Model Is Setup For Calculation of Average CONCentration Values.

  --  DEPOSITION LOGIC  --
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
**Model Uses NO WET DEPLETION.  WETDPLT  =  F

**Model Uses URBAN Dispersion Algorithm for the SBL for     2 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   1952872.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

**Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of:  OTHER

**Model Calculates  1 Short Term Average(s) of:   1-HR
    and Calculates PERIOD Averages

**This Run Includes:      2 Source(s);       2 Source Group(s); and     616 Receptor(s)

               with:      2 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                and:      0 VOLUME source(s)
                and:      0 AREA type source(s)
                and:      0 LINE source(s)
                and:      0 RLINE/RLINEXT source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with      0 line(s)
```

```
**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date:  18081

**Output Options Selected:
        Model Outputs Tables of PERIOD Averages by Receptor
        Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
        Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
        Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours

**Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    15.50 ;  Decay Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                           ;  Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =      3.6 MB of RAM.

**Input Runstream File:          City_Santa_Clara_5yrs_OTHER.DTA
**Output Print File:             City_Santa_Clara_5yrs_OTHER.LST

**File for Summary of Results:   C:\IrmasHRAs\Reg11Rule18\Plant_621\School\City_Santa_Clara_5yrs_OTHER.SUM

Calculating cancer risk

Cancer risk breakdown by pollutant and receptor saved to: C:\IrmasHRAs\Reg11Rule18\Plant_621\Final_Document621\June_2020_Revised
HRA\School\hra\StudentCancerRisk.csv

Cancer risk total by receptor saved to: C:\IrmasHRAs\Reg11Rule18\Plant_621\Final_Document621\June_2020_Revised
HRA\School\hra\StudentCancerRiskSumByRec.csv

Calculating chronic risk

Chronic risk breakdown by pollutant and receptor saved to: C:\IrmasHRAs\Reg11Rule18\Plant_621\Final_Document621\June_2020_Revised
HRA\School\hra\StudentNCChronicRisk.csv

Chronic risk total by receptor saved to: C:\IrmasHRAs\Reg11Rule18\Plant_621\Final_Document621\June_2020_Revised
HRA\School\hra\StudentNCChronicRiskSumByRec.csv

Calculating acute risk

Acute risk breakdown by pollutant and receptor saved to: C:\IrmasHRAs\Reg11Rule18\Plant_621\Final_Document621\June_2020_Revised
HRA\School\hra\StudentNCAcuteRisk.csv

Acute risk total by receptor saved to: C:\IrmasHRAs\Reg11Rule18\Plant_621\Final_Document621\June_2020_Revised
HRA\School\hra\StudentNCAcuteRiskSumByRec.csv

13. Appendix E – Land Use Determination

Land Use Determination from AERSURFACE

Plant 621 City of Santa Clara								
UTM Easting (meters):	593492.84							
UTM Northing (meters):	4135796.21							
UTM Zone: 10								
Datum: NAD83								
Study Radius for surface roughness (km):	3.0							
SECTOR: 1								
Starting Direction: 000						Urban%		
----------								
0 Missing, Out-of-Bounds, or Undefined:					0			
11 Open Water:					0			
12 Perennial Ice/Snow:					0			
21 Low Intensity Residential:					14509	50%		7254.5
22 High Intensity Residential:					190	100%		190
23 Commercial/Industrial/Transp:					11223	100%		11223
31 Bare Rock/Sand/Clay:					22			
32 Quarries/Strip Mines/Gravel:					0			
33 Transitional:					0			
41 Deciduous Forest:					1			
42 Evergreen Forest:					11			
43 Mixed Forest:					1			
51 Shrubland:					628			
61 Orchards/Vineyard/Other:					1086			
71 Grasslands/Herbaceous:					833			
81 Pasture/Hay:					0			
82 Row Crops:					0			
83 Small Grains:					0			
84 Fallow:					0			
85 Urban/Recreational Grasses:					2887			
91 Woody Wetlands:					0			
92 Emergent Herbaceous Wetlands:					35			

Total: 31426					31426			18667.5
						Urban% =	59%	
						Rural %	41%	

14. Appendix F – Wind Rose Plots

Wind Rose Plot for KSJC
