

Modeling Sources of Air Pollution

West Oakland Action Plan

West Oakland Steering Committee Meeting
March 6, 2019

Overview

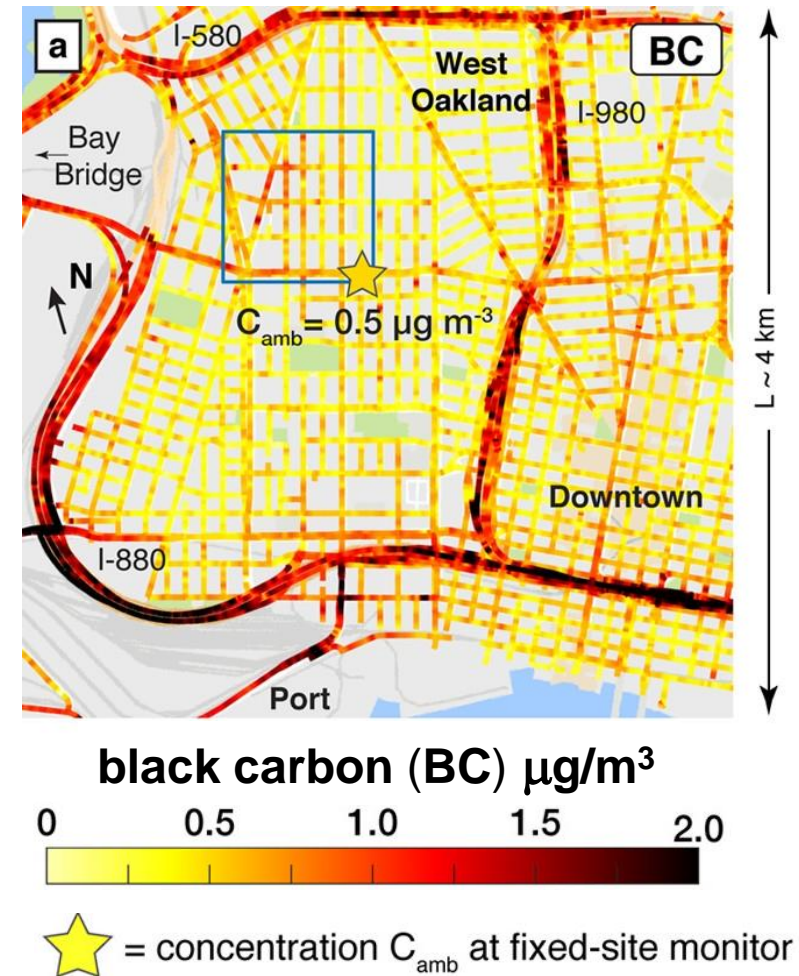

1. Goals of the technical assessment
2. Brief review of the modeling approach
3. Findings—what sources contribute to air pollution:
 - Residential impacts across West Oakland
 - Specific locations, including sensitive locations (schools, senior center, parks)
4. Summary

Goals of the Technical Assessment

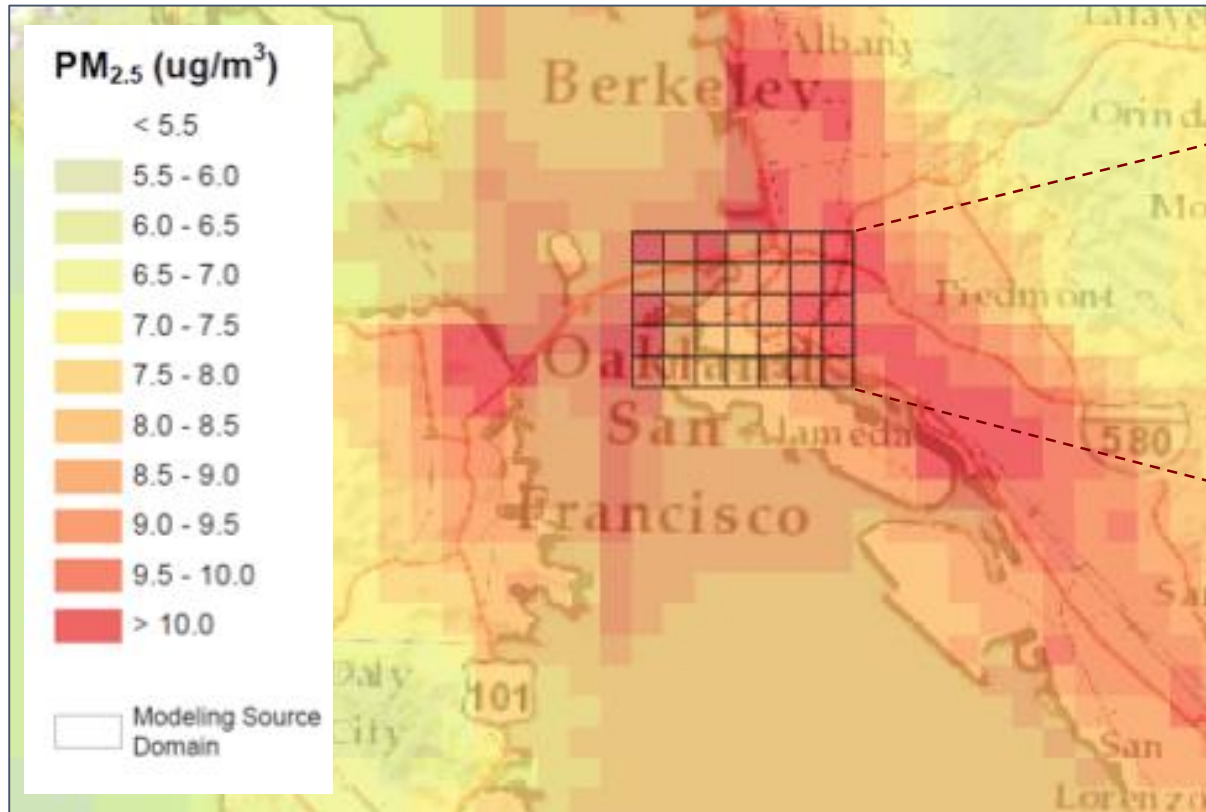

- Help identify strategies for the action plan
- Help prioritize measures
- Gain insight into how different sources of air pollution impact different locations in West Oakland
- Spur action by attributing impacts to specific sources

Why Model When We Can Measure?

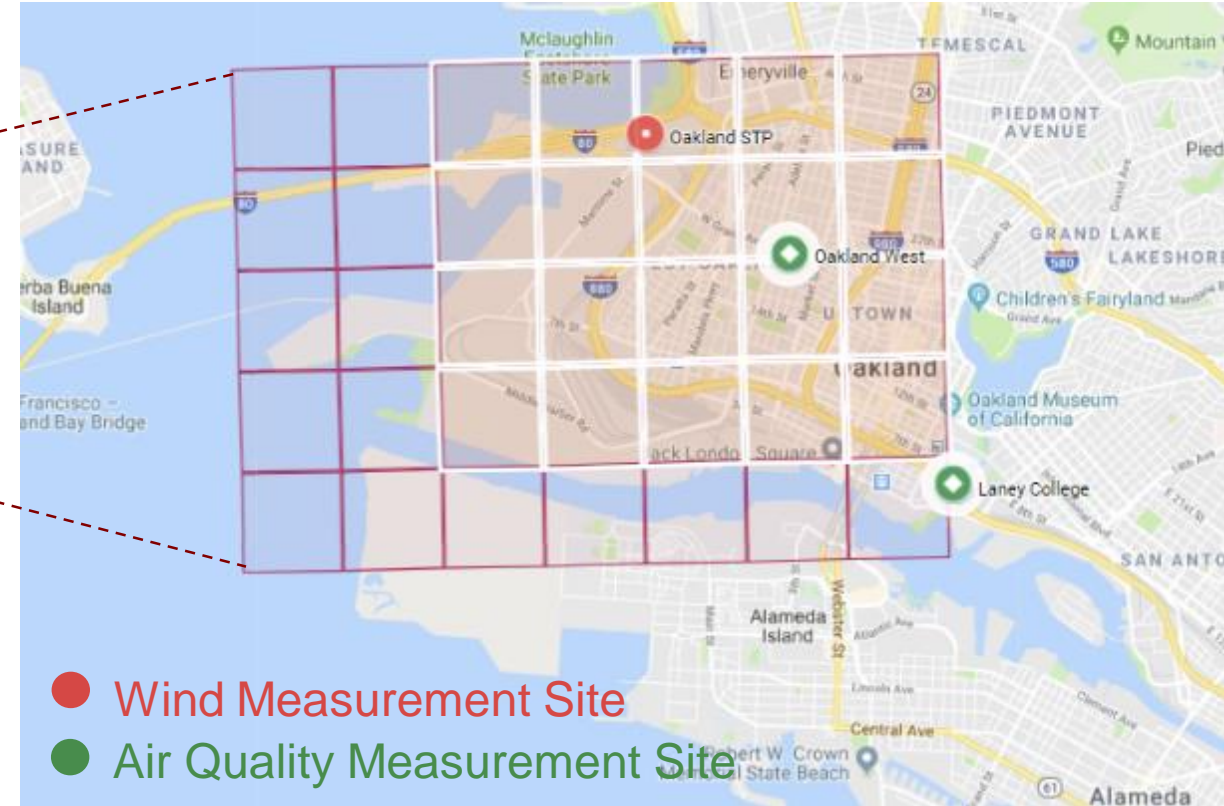

- With instrument-based **measurements**, we can *quantify* and *compare*
 - Example: Street View study. How much black carbon do we find on each street? Where is it highest?
- With computer-based **models**, we can *diagnose*, *explain*, and *drill down*
 - Where does the black carbon, or diesel PM, come from? What sources are responsible and contribute the most?

Air Quality Modeling Approach

Regional-scale modeling: covers the Bay Area

Local-scale modeling: covers West Oakland, including impacts in receptor area (white) from sources in source area (red)

Pollutants Modeled

The icon for PM 2.5 consists of the letters 'PM' stacked above the number '2.5'. The text is rendered in a brown, serif font with a subtle, grainy texture.

Fine Particulate Matter

The greatest health burden from air pollution is from particulate matter (PM).

Diesel PM

Diesel PM is highly toxic and poses the health burdens associated with fine PM.

Toxic Air Contaminants

Diesel PM and benzene, formaldehyde, acetaldehyde, hexavalent chromium, perchloroethylene, polycyclic aromatic hydrocarbons (PAHs), arsenic, dioxins, etc. ₆

Why Discuss Cancer Risk?

What is Cancer Risk?

- Combine the impacts of toxic air contaminants and emphasize the most toxic contaminants
- Health professionals have developed useful methods to address cancer risk
- Cancer risk is a rough indication of other kinds of health issues
- Cancer risk: for one million people exposed over a 30-year period, the expected number of cancer cases

West Oakland Modeled Sources

Port of Oakland

Trucks, ships, harbor craft, locomotives, cargo-handling equipment, and other off-road equipment

Trains

Passenger and freight

Permitted stationary sources

Metal melters, scrap handlers, diesel engines, backup generators, boilers, and gas stations

Cars and trucks

Freeways and surface streets

Truck-related businesses

Distribution centers, parking, recyclers, scrap handlers

Ships, ferries, harbor craft

Sources Not Included

Construction equipment

Construction and demolition for buildings, roads, etc.

Wood burning

Fireplaces, wood stoves, backyard cooking and fire pits

Restaurants

Grilling and meat cooking

Household sources

Lawn and garden equipment, paints, and household products

Miscellaneous activity

Amtrak maintenance yard, small truck businesses, some parking

Studio industries

Small artisans, business without Air District permits

Focusing on the Local

How Much is Local?

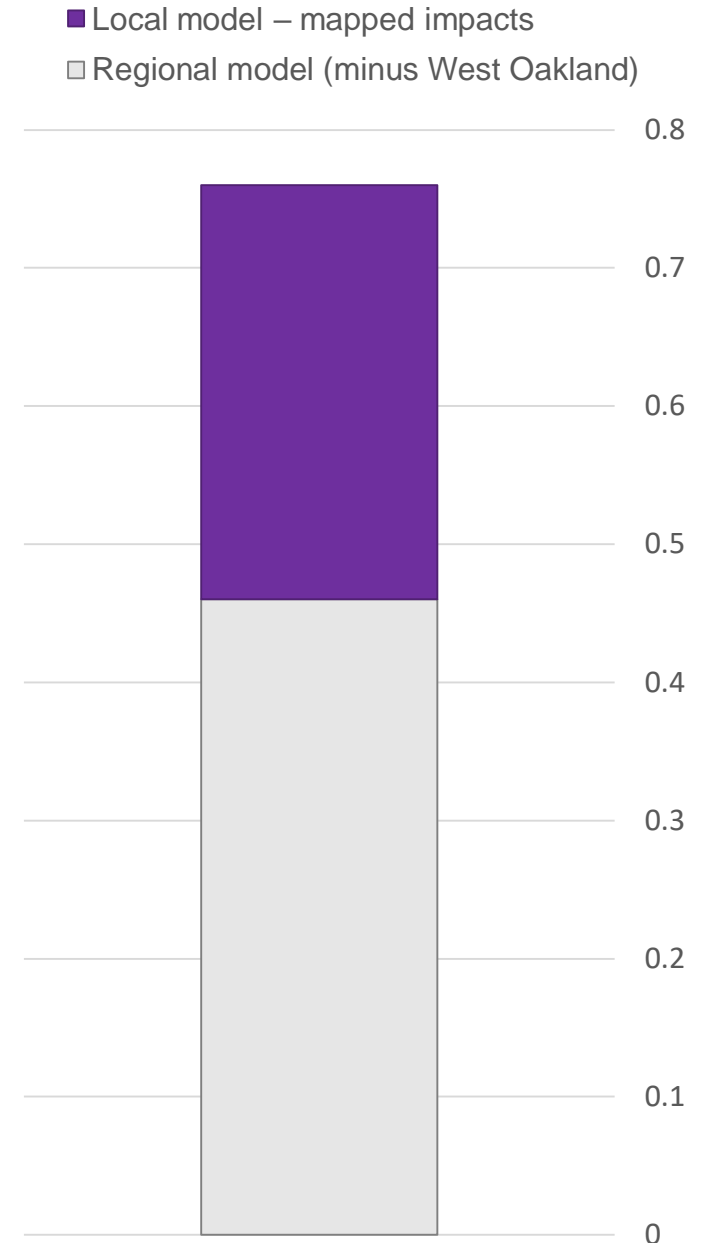

DRAFT 2019-03-04

Modeled Impact of Local Sources on Residential

Top Contributors*:

- Trucks (49%)
- Marine vessels (28%)
- Rail (17%)

Diesel PM

*Diesel PM from construction was not modeled

How Much is Local?

DRAFT 2019-03-04

Modeled Impact of Local Sources on Residential

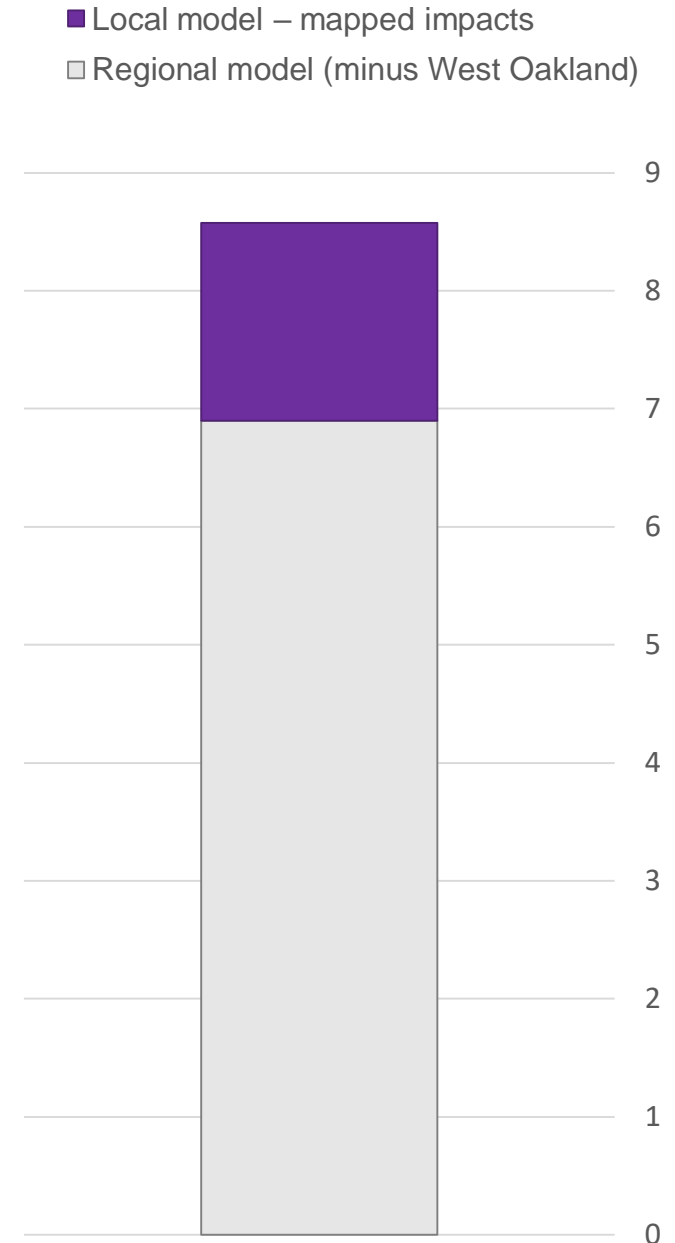

Top Contributors*:

- Road dust (36%)
- Passenger vehicles (27%)
- Permitted facilities (15%)
- Trucks (12%)

PM_{2.5}

*PM_{2.5} from construction, wood burning, cooking was not modeled

How Much is Local?

Cancer Risk

■ Local model – mapped impacts
□ Regional model (minus West Oakland)

DRAFT 2019-03-04

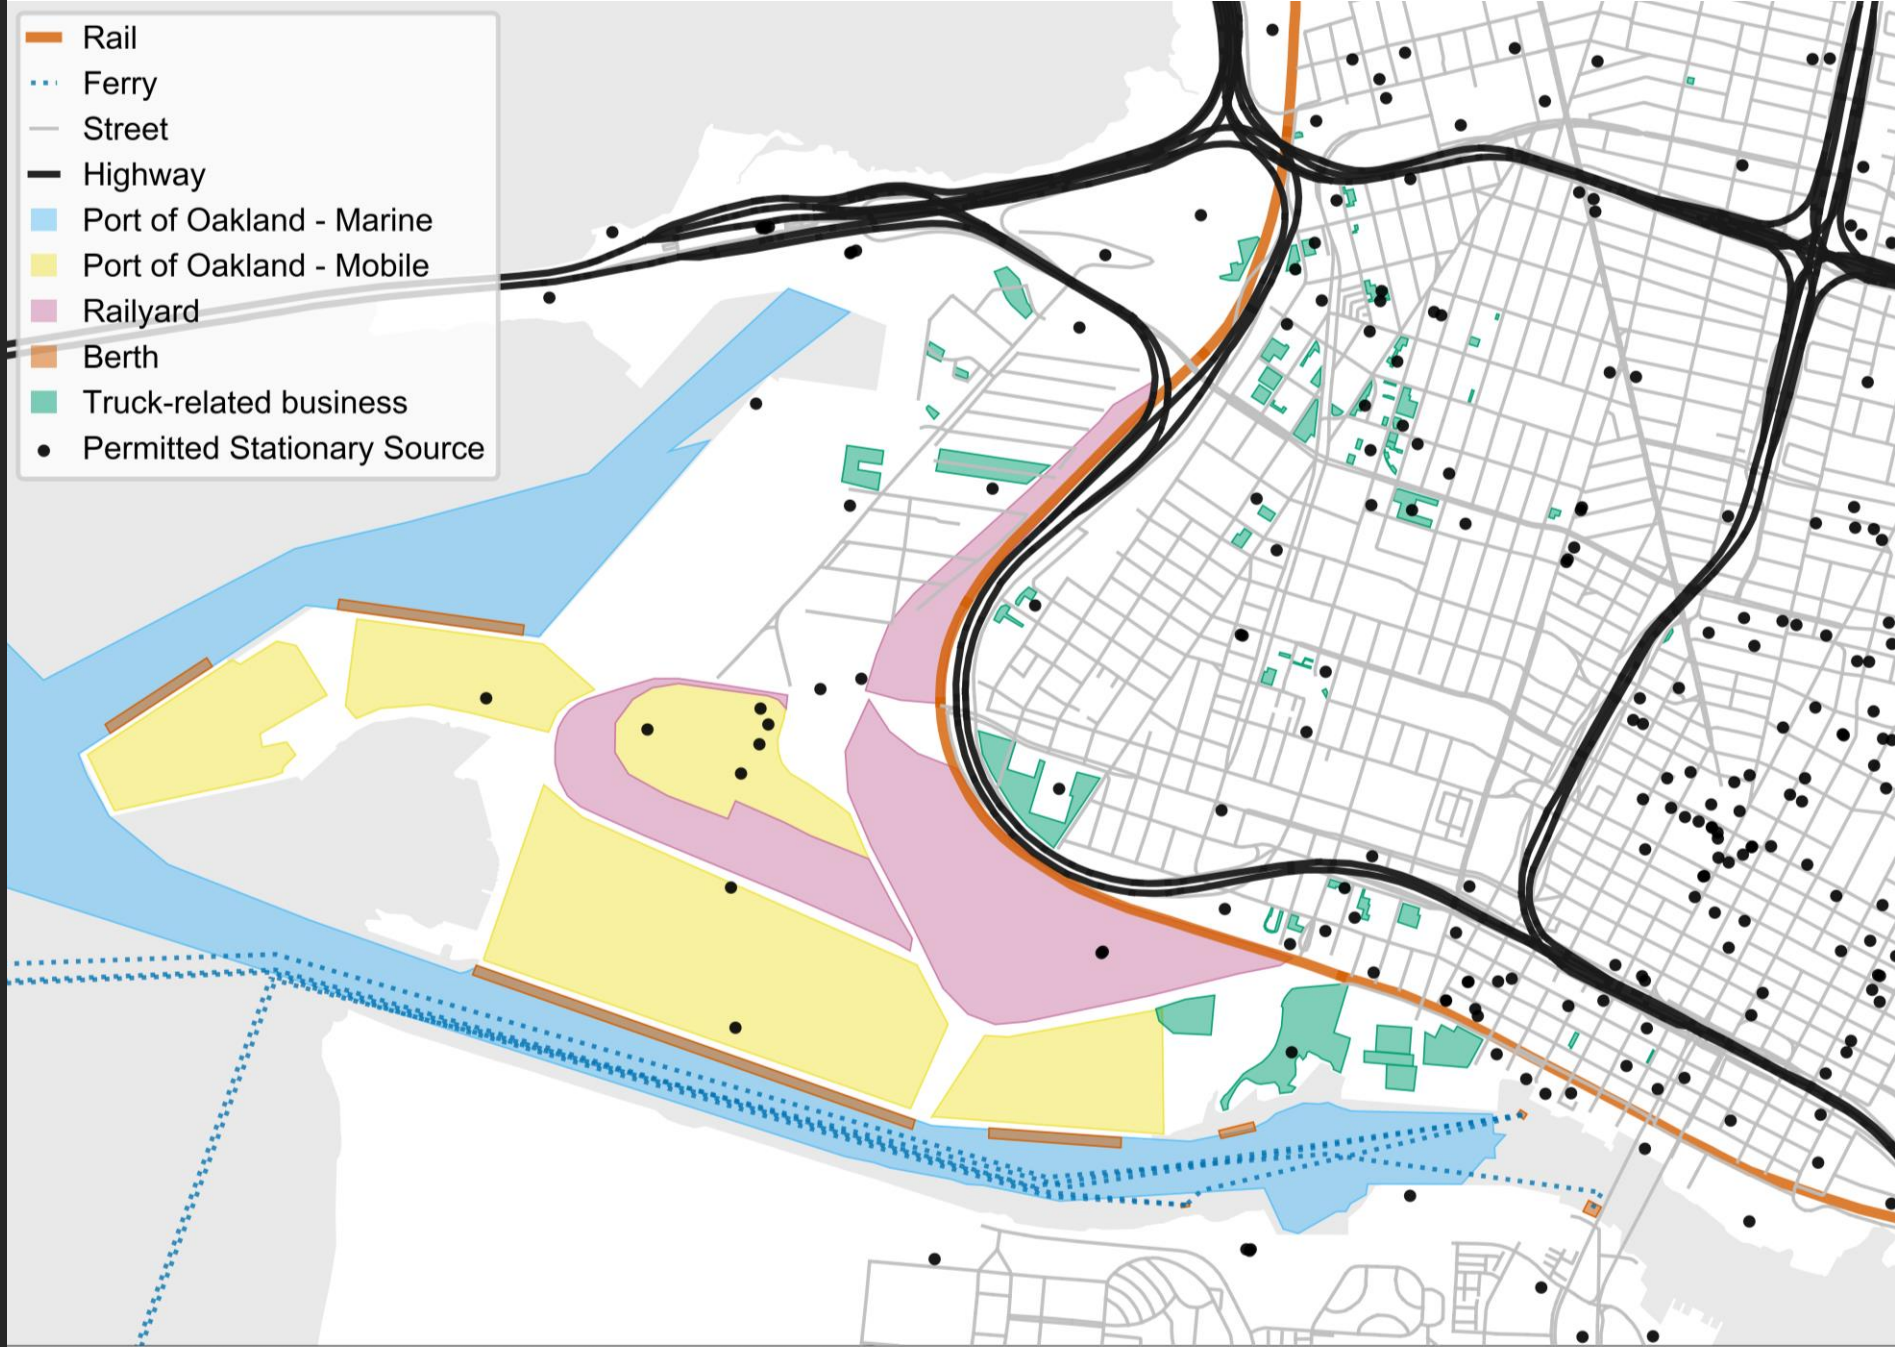

Modeled Impact of Local Sources on Residential

Top Contributors*:

- Trucks (33%)
- Marine vessels (31%)
- Permitted facilities (10%)

*Cancer risk from construction was not modeled

Local Sources that were Modeled

DRAFT 2019-03-04

*Port of Oakland - Marine – includes maneuvering, bunkering (tugs, pumps), harbor crafts, and dredging.
Port of Oakland - Mobile – includes Port Truck activity (idling, driving in-terminal and to highway) and cargo handling equipment.
Streets – includes on- and off-ramps.*

Specific Impacts

at Selected Locations

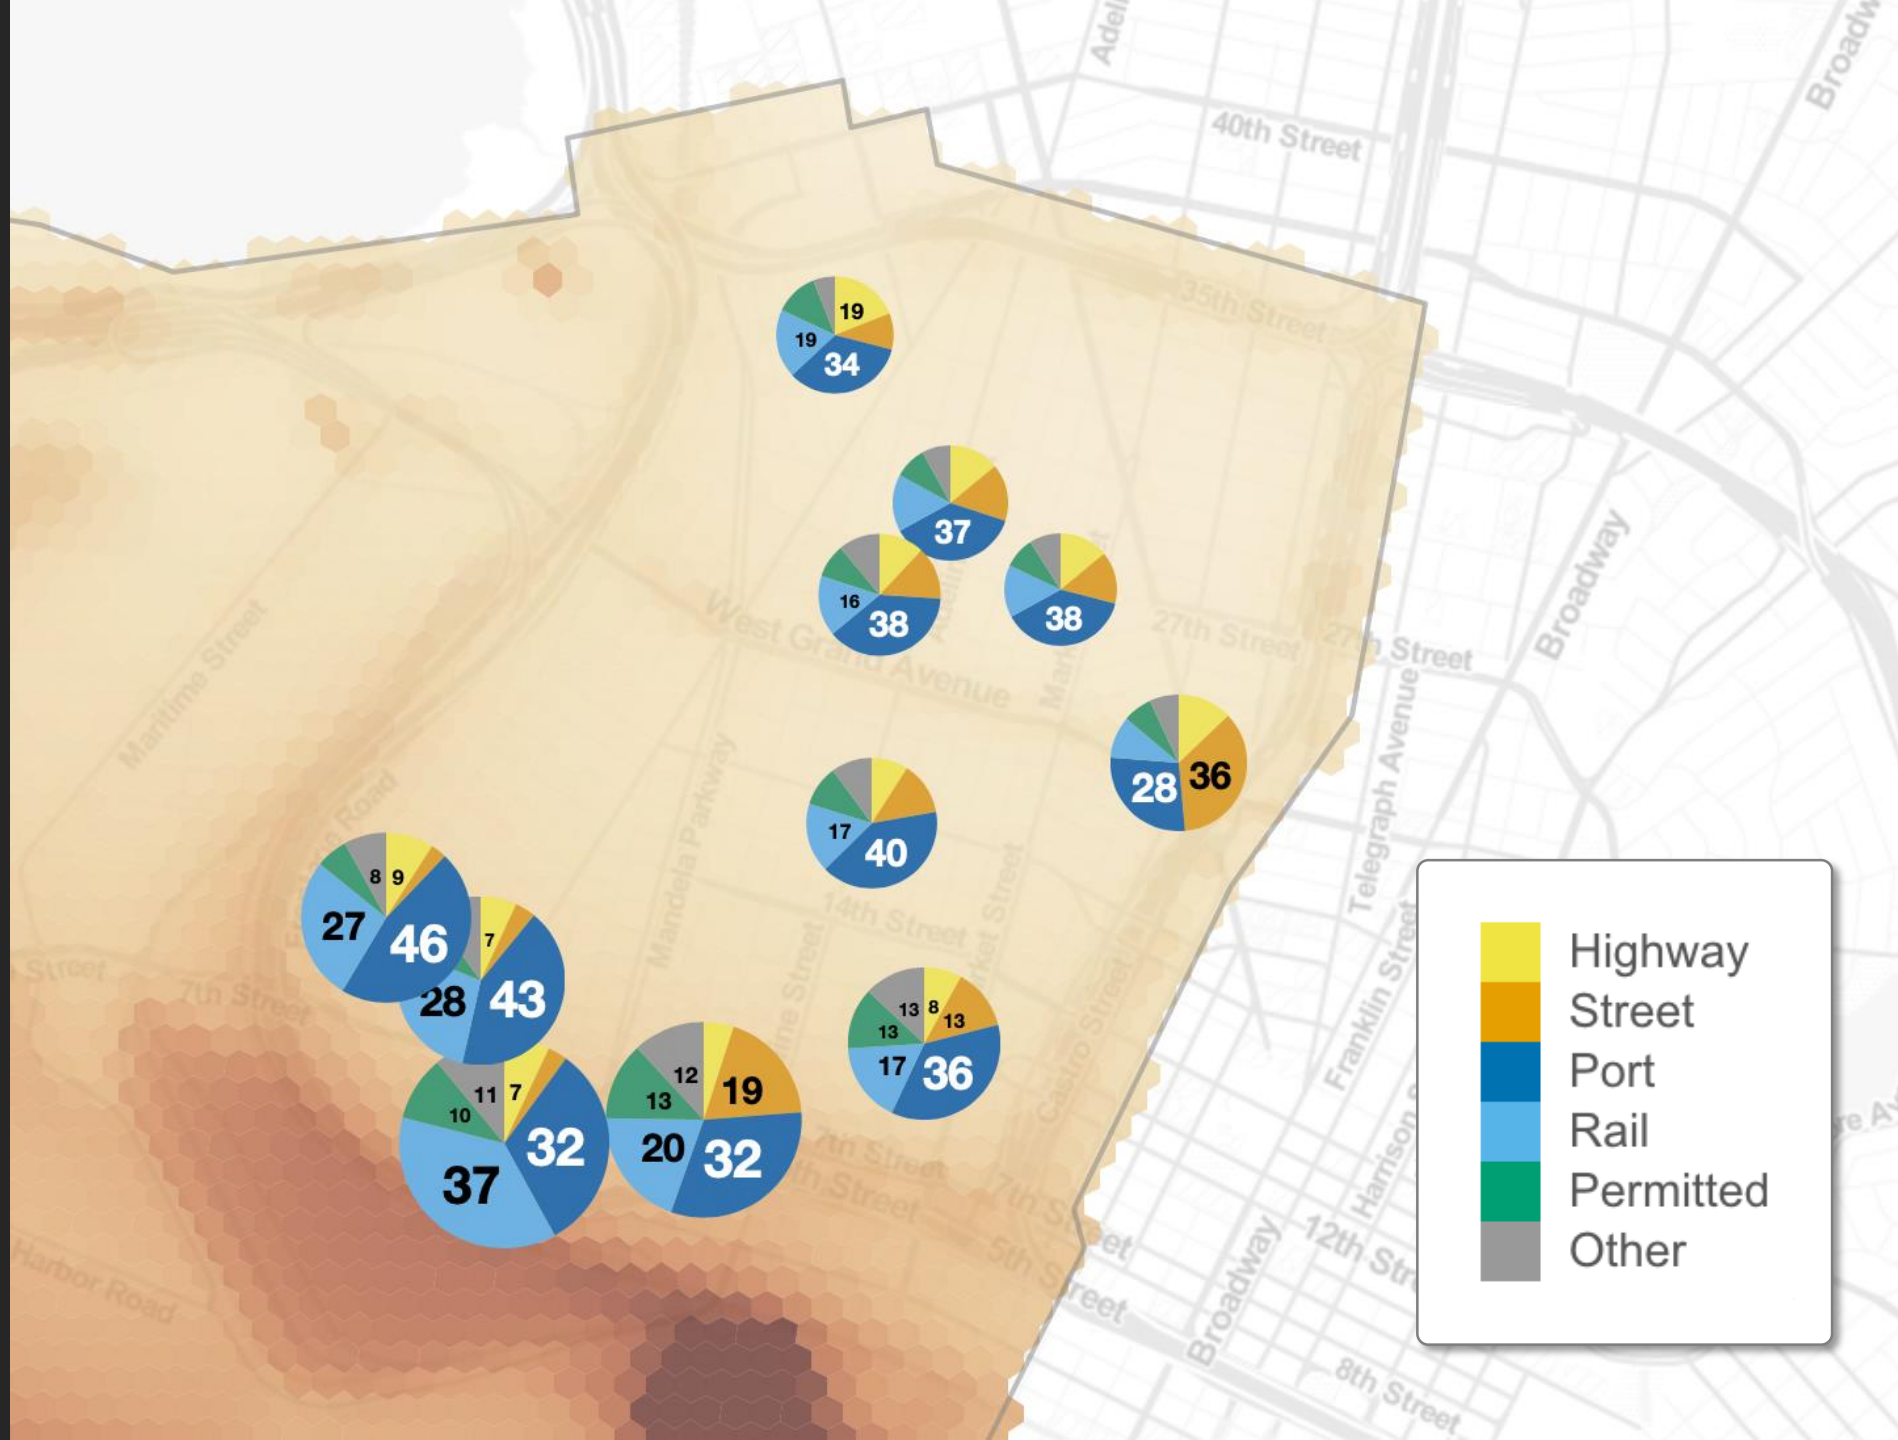

Diesel PM from local Sources at Specific Locations

PM_{2.5} from local Sources at Specific Locations

Cancer Risk from local Sources at Specific Locations

Summary

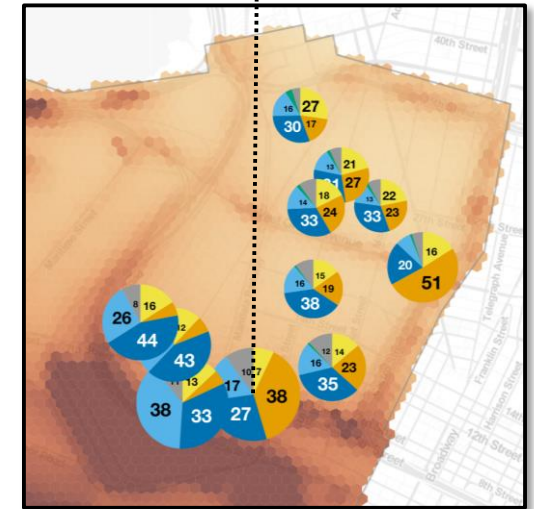

- Impacts vary with location and kind of pollutant
- Diesel PM and cancer risk are greatest in southern West Oakland, near Port, rail, and highway sources
- PM_{2.5} impacts are more spread out, with highest impacts near highways, busy streets, and some industries
- This study shows *block-by-block* what sources contribute most
