### **ENGINEERING EVALUATION**

## Facility ID No. 203431 Sutter Health Inc. 301 Old San Francisco Road, Sunnyvale, CA 94086 Application No. 696554

#### Background

Sutter Health Inc. is applying for an Authority to Construct/Permit to Operate for the following equipment:

## S-1 Emergency Standby Diesel Engine Make: Perkins, Model: 1104D-E44TA C4.4, Model Year: 2022 132 bhp, 0.90 MMBtu/hr Permit Condition Nos. 100072 and 100073

The criteria pollutants are nitrogen oxides (NOx), carbon monoxide (CO), precursor organic compounds (POC) from unburned diesel fuel, sulfur dioxide (SO<sub>2</sub>), and particulate matter ( $PM_{10}$  and  $PM_{2.5}$ ). All of these pollutants are briefly discussed on the Air District's website at <u>www.baaqmd.gov</u>.

S-1 meets the Environmental Protection Agency and California Air Resources Board (EPA/CARB) Tier 3 Off-road standard. The engine will burn commercially available California low-sulfur diesel fuel. The sulfur content of the diesel fuel will not exceed 0.0015% by weight.

Although this project will emit toxic air contaminants that have the potential to cause or contribute to adverse health impacts, the Air District has evaluated the permit application and has made a preliminary determination that the project is expected to comply with all applicable Air District, state, and federal air quality-related laws and regulations, including health protective limits for toxic air contaminant emissions.

### Emissions

Pollutant	Emission Factor (g/bhp-hr)	Max Daily Emissions (lb/day)	Annual Emissions (lb/year)	Annual Emissions (ton/year)
NOx	2.76	19.3	40.1	0.020
POC	0.09	0.6	1.3	0.001
CO	0.97	6.8	14.1	0.007
$PM_{10}/PM_{2.5}^{1}$	0.11	0.8	1.6	0.001
$SO_2$	0.006	0.04	0.1	0.000

### Table 1. Annual and Daily Emissions from EPA/CARB Certified Data from S-1

Basis:

- > Annual emissions: Reliability-related activity 50 hours for S-1
- ➤ Max daily emissions: 24-hour operation

- Emissions from EPA Engine Family NPKXL04.4NR1 for S-1
- hightarrow <sup>1</sup> Conservative Assumption: All PM emissions are PM<sub>2.5</sub>
- <sup>2</sup> SO<sub>2</sub> emission factor from AP-42 Table 3.4-1, SO<sub>2</sub> (15 ppm) = 0.00809\*0.0015 lb SO<sub>2</sub>/bhp-hr \* 453.6 g/lb= 0.006 g/bhp-hr

### Plant Cumulative Increase

Table 2 summarizes the cumulative increase in criteria pollutant emissions from this application.

Pollutant	Existing Emissions Post 4/5/91	Application Emissions	Cumulative Emissions
	(tons/year)	(tons/year)	(tons/year)
NOx	0.000	0.020	0.020
POC	0.000	0.001	0.001
CO	0.000	0.007	0.007
PM <sub>10</sub>	0.000	0.001	0.001
PM <sub>2.5</sub>	0.000	0.001	0.001
SO <sub>2</sub>	0.000	0.000	0.000

Tabla 2	Dlant	Cumulativa	Fmissions	Incrosso	Post 4/5/91
I able 2.	Flam	Cumulauve	LIIISSIOIIS	increase,	POSL 4/5/91

## Health Risk Assessment (HRA)

The diesel particulate emissions from the project are greater than the toxic trigger level of 0.26 lb/year. All  $PM_{10}$  emissions are considered diesel particulate emissions. The  $PM_{10}$  emissions from this application are summarized in Table 1. There were no other related projects permitted in the last five years. Since the diesel particulate emissions from the project are greater than the toxic trigger level of 0.26 lb/year, an HRA is required. This application does not qualify for HRA streamlining because the closest receptor is less than 31 feet from the source.

The project is in compliance with project risk requirements as recommended, limiting reliability-related activity hours by permit condition. See HRA report.

### HRA Results

This analysis estimates the incremental health risk resulting from toxic air contaminant (TAC) emissions from non-emergency operation of a standby generator diesel engine at this facility. Results from this HRA indicate that the maximum project cancer risk is estimated at 1.4 in a million, and the maximum project chronic hazard index is estimated at 0.00038. See HRA Report for more details.

Maximally Exposed Receptor	Maximum Cancer Risk	Maximum Chronic Hazard Index
Resident	1.4 chances in a million	0.00038
Off-site worker	0.37 chances in a million	0.00028
Student	0.078 chances in a million	0.000042

## **Table 3. Risk Screening Results**

## **TBACT**

In accordance with the District's Regulation 2-5-301, this source requires TBACT because the estimated source risk exceeds a cancer risk of 1.0 in a million. BACT and TBACT determinations for compression ignition engines with a rated capacity between 50-1000 bhp are described in BAAQMD BACT/TBACT Workbook for IC Engines – Compression Ignition: Stationary Emergency, non-Agricultural, non-direct drive fire pump, Document #96.1.3, Revision 8. dated 12/22/2020 (see Attachment 1). S-1 complies with TBACT by having a certified PM emission rate that is less than or equal to 0.15 g/bhp-hour. The certified PM emission rate for this engine is 0.11 g/bhp-hour.

## Project Risk Limits

Since the proposed engine, operating at 50 hours/year for reliability related testing, has an estimated project cancer risk that does not exceed 10 in a million, and the chronic hazard index does not exceed 1.0, this project complies with the District's Regulation 2-5-302 project risk requirements. No additional operating hour restrictions were necessary for this project.

# Best Available Control Technology (BACT)

In accordance with Regulation 2-2-301, BACT is triggered for any new or modified source with the potential to emit 10 pounds or more per highest day of POC, NPOC, NOx, CO, SO<sub>2</sub>,  $PM_{10}$  or  $PM_{2.5}$ .

As shown in Table 1, NOx emissions exceed 10 pounds per day and thus trigger BACT requirements for S-1.

Per Section 2-2-202, BACT is defined as an emission limitation, control device, or control technique applied at a source that is the most stringent of:

- > the most effective device or technique successfully utilized,
- the most stringent emission limitation achieved by an emission control device or technique for the type of equipment comprising such a source,
- the most effective emission control limitation for the type of equipment comprising such a source that is contained in an approved implementation plan of any state, or

the most effective control device or technique or most stringent emission limitation that is technologically feasible, taking into consideration cost-effectiveness, any ancillary health and environmental impacts, and energy requirements.

These requirements are generally categorized as either technologically feasible and costeffective (termed "BACT 1") or achieved-in-practice (termed "BACT 2").

BACT 2 is either equal to or less stringent than BACT 1. Because achieved-in-practice is required regardless of cost and BACT 1 is more stringent than BACT 2, an evaluation for what has been achieved-in-practice is first conducted.

### Achieved-in-Practice.

Achieved-in-practice BACT is presented in the current BAAQMD BACT/TBACT Workbook for IC Engine – Compression Ignition: Stationary Emergency, non-Agricultural, non-direct drive fire pump 50 BHP and < 1000 BHP Output, Document #96.1.3, Revision 8, dated 12/22/2020.

For NOx, achieved-in-practice BACT has been determined to be meeting the CARB Air Toxics Control Measure (ATCM) standard for the respective pollutant at the applicable horsepower rating.

## Technologically Feasible and Cost-Effective.

The following control technologies and mitigation measures have been found technically feasible for abating NOx emissions from internal combustion engines<sup>1</sup>:

- Engine ignition timing retard (achievable NOx reduction 20 to 30 percent), and
- Selective catalytic reduction (achievable NOx reduction of 90 percent)

Although Regulation 2-2 does not include a definition for cost-effectiveness, Section 2-2-414 requires the Air District to publish and periodically update a BACT Workbook and that BACT will be determined using the workbook as a guidance document.

Section 1 of the BACT Workbook includes a maximum cost guideline for NOx emissions of \$17,500 per ton of emissions reduced. Using these maximum cost-effectiveness values and assuming that 90 percent of the emissions in Table 1 could be abated, maximum annualized costs for NOx controls could not exceed \$315 to be deemed cost-effective for S-1.

All NOx controls are expected to exceed the maximum annualized costs. Therefore, requiring more stringent controls than meeting achieved-in-practice requirements is deemed not cost-effective.

<sup>&</sup>lt;sup>1</sup> United States Environmental Protection Agency. Control Techniques Guidelines for Alternative Control Techniques Document – NOx Emissions from Stationary Reciprocating Internal Combustion Engines. EPA-453/R-93-032. July 1993. Updated September 2000.

Consequently, S-1 is required to comply with the current achieved-in-practice standards:

Pollutant	<b>Emission Factor</b>	BACT(2) Standard
NOx	2.76 g/bhp-hr	2.85 g/bhp-hr *

\* The standard is expressed as 3.0 g/bhp of NMHC+NOx. NOx is estimated to be 95% of the combined standard (3.0\*0.95 = 2.85 g/bhp-hr)

## **Offsets**

Offset must be provided for any new or modified source at a facility that will have the potential to emit more than 10 tons per year of NOx or POC, as specified in Regulation 2-2-302; 100 tons per year or more of  $PM_{2.5}$ ,  $PM_{10}$  or sulfur dioxide, as specified in Regulation 2-2-303.

Pollutant	Existing Annual Emissions (TPY)	Application Annual Emissions* (TPY)	Facility Annual Emissions* (TPY)	Offset Requirement (TPY)	Offset Required
NOx	0.000	0.060	0.060	>10	Ν
POC	0.000	0.002	0.002	>10	Ν
СО	0.000	0.021	0.021	-	Ν
PM <sub>10</sub>	0.000	0.002	0.002	≥100	Ν
PM <sub>2.5</sub>	0.000	0.002	0.002	≥100	Ν
$SO_2$	0.000	0.000	0.000	≥100	Ν

### Table 4. Potential to Emit for FID 203431

\*Annual emissions: Reliability-related activity of 50 hours and emergency operation of 100 hours for a total of 150 hours for S-1.

Since the facility's potential to emit is below the offsets trigger levels specified in Regulation 2-2, offsets are not required.

## **Statement of Compliance**

The owner/operator is expected to comply with all applicable requirements. Key requirements are listed below:

#### Airborne Toxic Control Measure for Stationary Compression Ignition Engines ATCM, 5/19/2011, Section 93115, Title 17, CA Code of Regulations

## **District Rules**

Regulation 6-1-303 (*Ringelmann No. 2 Limitation*) Regulation 6-1-305 (*Visible Particles*) Regulation 6-1-310 (*Total Suspended Particulate (TSP) Concentration Limits*) Sections 6-1-310.1 and 6-1-310.2 limit TSP emissions to 0.15 grains/dscf of exhaust gas volume or less depending on the exhaust gas rate (see Table 6-1-310.2 for the corresponding TSP concentration limit). The certified particulate emission rate from S-1 is 0.11 grams per bhp-hour, which results in an outlet grain loading of 0.0186 gr/dscf. Since the emission rate is less than the 0.15 gr/dscf limit in Section 6-1-310, compliance with this section is expected.

 Regulation 9-1-301 (*Limitations on Ground Level Concentrations of SO*<sub>2</sub>)
 Regulation 9-8 (*NOx and CO from Stationary Internal Combustion Engines*) Section 9-8-110.5 – Limited exemption for emergency standby engines Section 9-8-330 – Hours of operation for emergency standby engines Section 9-8-502 – Recordkeeping

## California Environmental Quality Act (CEQA)

The existing use of the facility on which the generator will be installed and operated is an out-patient medical services facility. This additional engine and the structure associated with it is a negligible expansion of that use and the engine will only be used for the purpose of providing power within the facility in the event of an emergency.

The 2024 California Environmental Quality Act (CEQA) Statutes and Guidelines lists classes of projects in Section 15300, which have been determined not to have a significant effect on the environment and which shall, therefore, be exempt from the provisions of CEQA.

Section 15301 lists Class 1 projects that involve negligible or no expansion of use. This includes additions to existing structures provided that the addition will not result in an increase of more than 50 percent of the floor area of the structures before the addition, or 2,500 square feet, whichever is less, as listed in Section 15301(e)(1). The floor area in this situation is the facility which equates to approximately 141,100 square feet. 50% of this would be 70,550 square feet.

The footprint of the project area is 1,800 square feet which includes the emergency generator. Since the footprint of the emergency engine is not expected to exceed 50 percent of the floor area of the existing structure, or 2,500 square feet, this project is exempt from the provisions of CEQA and no further CEQA analysis is required.

Further, based on the review of the permit application materials, including Appendix H, environmental information form, the project will not have any significant environmental impacts, and cumulative impacts from successive projects of the same type in the same place will not result in significant environmental impacts. The Air District does not expect there to be successive projects similar to this one at this same place, since this engine will satisfy the need for fire prevention throughout the facility.

### **New Source Performance Standards (NSPS)**

40 CFR 60, Subpart IIII (Stationary Compression Ignition Internal Combustion Engines)

## National Emissions Standards for Hazardous Air Pollutants (NESHAP)

40 CFR 63, Subpart ZZZZ (*Stationary Reciprocating Internal Combustion Engines* (*RICE*))

### **Prevention of Significant Deterioration (PSD)**

This application is not part of a PSD project as defined in Regulation 2-2.

#### Public Notification (Regulation 2-1-412)

The public notification requirements of Regulation 2-1-412 apply to new or modified projects which either 1) will result in an increase in the emission of toxic air contaminant, hazardous air contaminant, or is on the list required to be prepared pursuant to subdivision (a) of Section 25532 or Section 44321 subsections (a) to (f) inclusive of the Health and Safety Code and are located within 1,000 feet of the boundary of a K-12 school, or 2) are located within an overburdened community (OBC) and require an HRA. The project involves a new source and, though the facility site is not located within an OBC, the following K-12 schools are located within 1,000 feet of the source and the project will increase toxic air contaminant emissions:

• Helios School (K-8) (597 Central Ave, Sunnyvale CA 94086)

Therefore, this application is subject to the public notification requirements of Regulation 2-1-412.

### **Permit Conditions**

### Permit Condition #100072 for S-1

- The owner or operator shall operate each emergency standby engine only for the following purposes: to mitigate emergency conditions, for emission testing to demonstrate compliance with a District, state or Federal emission limit, or for reliability-related activities (maintenance and other testing, but excluding emission testing). Operating while mitigating emergency conditions or while emission testing to show compliance with District, state or Federal emission limits is not limited. [Basis: Title 17, California Code of Regulations, Section 93115, ATCM for Stationary CI Engines]
- The owner/operator shall operate each emergency standby engine only when a non-resettable totalizing meter (with a minimum display capability of 9,999 hours) that measures the hours of operation for the engine is installed, operated and properly maintained.
   [Basis: Title 17, California Code of Regulations, Section 93115, ATCM for Stationary CI Engines]

- 3. Records: The owner/operator shall maintain the following monthly records in a District-approved log for at least 36 months from the date of entry (60 months if the facility has been issued a Title V Major Facility Review Permit or a Synthetic Minor Operating Permit). Log entries shall be retained on-site, either at a central location or at the engine's location, and made immediately available to the District staff upon request.
  - a. Hours of operation for reliability-related activities (maintenance and testing).
  - b. Hours of operation for emission testing to show compliance with emission limits.
  - c. Hours of operation (emergency).
  - d. For each emergency, the nature of the emergency condition. Fuel usage for each engine(s).

[Basis: Title 17, California Code of Regulations, Section 93115, ATCM for Stationary CI Engines]

- 4. At School and Near-School Operation: If the emergency standby engine is located on school grounds or within 1000 feet of any school grounds, the following requirements shall apply: The owner or operator shall not operate each stationary emergency standby diesel-fueled engine for non-emergency use, including maintenance and testing, during the following periods:
  - a. Whenever there is a school sponsored activity (if the engine is located on school grounds)

b. Between 7:30 a.m. and 3:30 p.m. on days when school is in session. 'School' or 'School Grounds' means any public or private school used for the purposes of the education of more than 12 children in kindergarten or any of grades 1 to 12, inclusive, but does not include any private school in which education is primarily conducted in a private home(s). 'School' or 'School Grounds' includes any building or structure, playground, athletic field, or other areas of school property but does not include unimproved school property.

[Basis: Title 17, California Code of Regulations, Section 93115, ATCM for Stationary CI Engines]

## Permit Condition #100073 for S-1

The owner/operator shall not exceed the following limits per year per engine for reliability-related activities:

• 50 Hours of Diesel fuel (Diesel fuel)

[Basis: Cumulative Increase; Regulation 2-5; Title 17, California Code of Regulations, Section 93115, ATCM for Stationary CI Engines]

## End of Conditions

### **Recommendation**

The Air District has reviewed the material contained in the permit application for the proposed project and has made a preliminary determination that the project is expected to comply with all applicable requirements of the Air District, state, and federal air quality-related regulations. The preliminary determination is to issue an Authority to Construct/Permit to Operate for the equipment listed below. However, the proposed source is within 1000 ft of Helios School (K-8) and will result in an increase of the toxic air contaminants, which triggers the public notification requirements of Air District will make a final determination on the permit.

I recommend that the Air District initiate a public notice and consider any comments received before taking any final action on issuance of an Authority to Construct for the following source:

S-1 Emergency Standby Diesel Engine Make: Perkins, Model: 1104D-E44TA C4.4, Model Year: 2022 132 bhp, 0.90 MMBtu/hr Permit Condition Nos. 100072 and 100073
