Bagging Data Form — Vacuum Method

Sample Id A04 A/B/C

WSPA — Western States Petroleum Association

Equipment type:	Valve	**Component ID:**	A-464
Equipment Subtype:	Gate	**Plant ID:**	Refinery A
Line Size:	4 *inches*	**Date:**	23-Feb-17
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR
Barometric pressure	30.22 *inHg* / 767.6 *mmHg*	**Sample Pump ID**	BU51791
Ambient Temperature:	56 °F / 13.3 °C	**TVA ID**	9509
Stream Temperature:	°F / -17.8 °C	**Stream pressure:**	*psig*
Stream Description:	*LGO Min Flow*		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: A05 A/B

WSPA — Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	A-325	
Equipment Subtype:	Control			**Plant ID:**	Refinery A	
Line Size:	4	*inches*		**Date:**	23-Feb-17	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	30.17 *inHg*	766.3	*mmHg*	**Sample Pump ID**	BU51791	
Ambient Temperature:	59.3 *°F*	15.2	*°C*	**TVA ID**	9509	
Stream Temperature:	*°F*	-17.8	*°C*	**Stream pressure:**		*psig*
Stream Description:	*LGO Product*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: A06 A/B

WSPA Western States Petroleum Association

Equipment type:	Valve		**Component ID:**	A-1259	
Equipment Subtype:	Gate		**Plant ID:**	Refinery A	
Line Size:	6 *inches*		**Date:**	24-Feb-17	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	30.2 *inHg*	767.1 *mmHg*	**Sample Pump ID**	BU51791	
Ambient Temperature:	52.6 °*F*	11.4 °*C*	**TVA ID**	9509	
Stream Temperature:	°*F*	-17.8 °*C*	**Stream pressure:**	*psig*	
Stream Description:	*Diesel*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form **Vacuum Method** **Sample Id** A07 A/B

Equipment type:	Valve		**Component ID:**	1245	
Equipment Subtype:	Gate		**Plant ID:**	Refinery A	
Line Size:	6 *inches*		**Date:**	24-Feb-17	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	30.19 *inHg*	766.8 *mmHg*	**Sample Pump ID**	BU51791	
Ambient Temperature:	53.5 *°F*	11.9 *°C*	**TVA ID**	9509	
Stream Temperature:	*°F*	-17.8 *°C*	**Stream pressure:**	*psig*	
Stream Description:	*Diesel*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id A08 A/B

Equipment type:	Valve		**Component ID:**	A-1241	
Equipment Subtype:	Gate		**Plant ID:**	Refinery A	
Line Size:	4	*inches*	**Date:**	27-Feb-17	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.92 *inHg*	760.0 *mmHg*	**Sample Pump ID**	BU51791	
Ambient Temperature:	55.1 *°F*	12.8 *°C*	**TVA ID**	9509	
Stream Temperature:	*°F*	-17.8 *°C*	**Stream pressure:**		*psig*
Stream Description:	*Diesel*				

WSPA Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form	Vacuum Method			Sample Id	A09 A/B
Equipment type:	Connector			Component ID:	A-1239
Equipment Subtype:	Flange			Plant ID:	Refinery A
Line Size:	4 inches			Date:	27-Feb-17
Phase (G, LL, HL):	HL			Analysis team:	EG/DR
Barometric pressure	29.91 inHg	759.7 mmHg		Sample Pump ID	BU51791
Ambient Temperature:	57.7 °F	14.3 °C		TVA ID	9509
Stream Temperature:	°F	-17.8 °C		Stream pressure:	psig
Stream Description:	Diesel				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form	**Vacuum Method**		**Sample Id**	**A011 A/B**
Equipment type:	Valve		**Component ID:**	**A-1259**
Equipment Subtype:	Gate		**Plant ID:**	Refinery A
Line Size:	6 *inches*		**Date:**	28-Feb-17
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR
Barometric pressure	30.16 *inHg*	766.1 *mmHg*	**Sample Pump ID**	BU51791
Ambient Temperature:	54.3 *°F*	12.4 *°C*	**TVA ID**	9509
Stream Temperature:	*°F*	-17.8 *°C*	**Stream pressure:**	*psig*
Stream Description:	*Diesel to the Diesel Stripper*			

WSPA Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: A012 A/B

Equipment type:	Valve	**Component ID:**	A-1305
Equipment Subtype:	Gate	**Plant ID:**	Refinery A
Line Size:	4 *inches*	**Date:**	28-Feb-17
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR
Barometric pressure	30.15 *inHg* / 765.8 *mmHg*	**Sample Pump ID**	BU51791
Ambient Temperature:	63.1 °F / 17.3 °C	**TVA ID**	9509
Stream Temperature:	°F / -17.8 °C	**Stream pressure:**	*psig*
Stream Description:	*Diesel at Fin Fans*		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form **Vacuum Method** **Sample Id** **A013 A/B**

WSPA
Western States Petroleum Association

Equipment type:	Connector			**Component ID:**	**A-901**	
Equipment Subtype:	Hatch Cover			**Plant ID:**	Refinery A	
Line Size:	24 *inches*			**Date:**	1-Mar-17	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	30.37 *inHg*	771.4	*mmHg*	**Sample Pump ID**	BU51791	
Ambient Temperature:	65 *°F*	18.3	*°C*	**TVA ID**	9509	
Stream Temperature:	*°F*	-17.8	*°C*	**Stream pressure:**		*psig*
Stream Description:	*Diesel*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form	Vacuum Method		Sample Id	A015 A/B
Equipment type:	Connector		Component ID:	A-1038
Equipment Subtype:	Union		Plant ID:	Refinery A
Line Size:	1 inches		Date:	2-Mar-17
Phase (G, LL, HL):	HL		Analysis team:	EG/DR
Barometric pressure	30.32 inHg	770.1 mmHg	Sample Pump ID	BU51791
Ambient Temperature:	57.7 °F	14.3 °C	TVA ID	9509
Stream Temperature:	317 °F	158.3 °C	Stream pressure:	psig
Stream Description:	HE 4637 Kerosene Tubeside Inlet			

WSPA Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form	Vacuum Method			Sample Id	A017 A/B		
Equipment type:	Connector			Component ID:	A-1050		
Equipment Subtype:	Plug			Plant ID:	Refinery A		
Line Size:	1	inches		Date:	2-Mar-17		
Phase (G, LL, HL):	HL			Analysis team:	EG/DR		
Barometric pressure	30.24	inHg	768.1 mmHg	Sample Pump ID	BU51791		
Ambient Temperature:	77.2	°F	25.1 °C	TVA ID	9509		
Stream Temperature:	330	°F	165.6 °C	Stream pressure:		psig	
Stream Description:	HE 4637 Kerosene Tubeside Inlet						

WSPA Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: **A018 A/B**

WSPA Western States Petroleum Association

Equipment type:	Valve	**Component ID:**	A-1014
Equipment Subtype:	Gate	**Plant ID:**	Refinery A
Line Size:	4 inches	**Date:**	6-Mar-17
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR
Barometric pressure	30.22 inHg / 767.6 mmHg	**Sample Pump ID**	BU51791
Ambient Temperature:	66 °F / 18.9 °C	**TVA ID**	9509
Stream Temperature:	°F / -17.8 °C	**Stream pressure:**	psig
Stream Description:	HE 4149 Kerosene Shell Side Outlet		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form **Vacuum Method** **Sample Id** **A019 A/B**

WSPA Western States Petroleum Association

Equipment type:	Connector			**Component ID:**	A-1050	
Equipment Subtype:	Plug			**Plant ID:**	Refinery A	
Line Size:	1	*inches*		**Date:**	6-Mar-17	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	30.23	*inHg*	767.8 *mmHg*	**Sample Pump ID**	BU51791	
Ambient Temperature:	70.8	°F	21.6 °C	**TVA ID**	9509	
Stream Temperature:	330	°F	165.6 °C	**Stream pressure:**		*psig*
Stream Description:	*HE 4637 Kerosene Tubeside Inlet*					

REPEAT TEST

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form	Vacuum Method		Sample Id	A020 A/B
Equipment type:	Valve		Component ID:	A-1444
Equipment Subtype:	Gate		Plant ID:	Refinery A
Line Size:	6 inches		Date:	7-Mar-17
Phase (G, LL, HL):	HL		Analysis team:	EG/DR
Barometric pressure	30.32 inHg	770.1 mmHg	Sample Pump ID	BU51791
Ambient Temperature:	78.2 °F	25.7 °C	TVA ID	9509
Stream Temperature:	52 °F	11.1 °C	Stream pressure:	psig
Stream Description:	Diesel Mid Pump Around			

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
STP = 294.15 K & 760 mmHg

Bagging Data Form — Vacuum Method

Sample Id A022 A/B

WSPA — Western States Petroleum Association

Equipment type:	Valve	**Component ID:**	A-1008
Equipment Subtype:	Gate	**Plant ID:**	Refinery A
Line Size:	4 *inches*	**Date:**	8-Mar-17
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR
Barometric pressure	30.26 *inHg* 768.6 *mmHg*	**Sample Pump ID**	BU51791
Ambient Temperature:	67 °F 19.4 °C	**TVA ID**	9509
Stream Temperature:	°F -17.8 °C	**Stream pressure:**	*psig*

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 Ton = 2,000 pounds

Stream Description: *HE 4149 Kerosene Shell Side Inlet*

A022A

Bagging Data Form — Vacuum Method

Sample Id: A025 A/B

WSPA — Western States Petroleum Association

Equipment type:	Pump P-3942			Component ID:	A-1722
Equipment Subtype:	Connector - Threaded			Plant ID:	Refinery A
Line Size:	1 inches			Date:	8-Mar-17
Phase (G, LL, HL):	HL			Analysis team:	EG/DR
Barometric pressure	30.19 inHg	766.8	mmHg	Sample Pump ID	BU51791
Ambient Temperature:	79.3 °F	26.3	°C	TVA ID	9509
Stream Temperature:	°F	-17.8	°C	Stream pressure:	psig
Stream Description:	Depentanizer Bottoms				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form **Vacuum Method** **Sample Id** **A027 A/B**

WSPA Western States Petroleum Association

Equipment type:	Pump P9668			**Component ID:**	A-1728
Equipment Subtype:	Connector - Threaded			**Plant ID:**	Refinery A
Line Size:	1 *inches*			**Date:**	9-Mar-17
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR
Barometric pressure	30.17 *inHg*	766.3 *mmHg*		**Sample Pump ID**	BU51791
Ambient Temperature:	76.4 *°F*	24.7 *°C*		**TVA ID**	9509
Stream Temperature:	170 *°F*	76.7 *°C*		**Stream pressure:**	500 *psig*
Stream Description:	*M-5239 P-9668 Feed Charge Pump*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: AO30A/B

WSPA Western States Petroleum Association

Equipment type:	Connector		**Component ID:**	A-1050	
Equipment Subtype:	Bull Plug		**Plant ID:**	Refinery A	
Line Size:	1	inches	**Date:**	10-Mar-17	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	30.13 inHg	765.3 mmHg	**Sample Pump ID**	BU51791	
Ambient Temperature:	80 °F	26.7 °C	**TVA ID**	9509	
Stream Temperature:	310 °F	154.4 °C	**Stream pressure:**		psig
Stream Description:	HE 4637 Kerosene Tube side Inlet				

REPEAT Sorbent Tube cracked upon receipt.

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds
STP = 294.15 K & 760 mmHg

Bagging Data Form	**Vacuum Method**		**Sample Id**	**A032A/B**
Equipment type:	Valve		**Component ID:**	A-28
Equipment Subtype:	Gate		**Plant ID:**	Refinery A
Line Size:	10 *inches*		**Date:**	14-Mar-17
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR
Barometric pressure	30.04 *inHg*	763.0 *mmHg*	**Sample Pump ID**	BU51791
Ambient Temperature:	76.6 *°F*	24.8 *°C*	**TVA ID**	9509
Stream Temperature:	*°F*	-17.8 *°C*	**Stream pressure:**	*psig*
Stream Description:	*E4256 Recycled Gas Oil*			

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id A034A/B

WSPA Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	A-415
Equipment Subtype:	Gate			**Plant ID:**	Refinery A
Line Size:	1 *inches*			**Date:**	14-Mar-17
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR
Barometric pressure	30.02 *inHg*	762.5 *mmHg*		**Sample Pump ID**	BU51791
Ambient Temperature:	83.4 °F	28.6 °C		**TVA ID**	9509
Stream Temperature:	°F	-17.8 °C		**Stream pressure:**	*psig*
Stream Description:	*Light Gas Oil P/A to #4 Gas*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Refinery B Sample Results

Bagging Data Form **Vacuum Method** **Sample Id** **B01**

Equipment type:	Connector			**Component ID:**	B-218	
Equipment Subtype:	Plug			**Plant ID:**	Refinery B	
Line Size:	3/4	inches		**Date:**	19-Jul-17	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.94 inHg	760.5	mmHg	**Sample Pump A**	BU51790	
				Sample Pump B	BU51292	
Ambient Temp:	75.8 °F	24.3	°C	**TVA ID**	2337	
Component Temp:	95 °F	35.0	°C	**Stream Pressure/Temp:**	psig	°F
Stream Description:	Heavy Diesel Return					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Pre-Sample Data

Time									
10:00	Background	1.6 ppmv	8-sec Dwell	28 ppmv	Total Dwell	2:50 min:sec	Final M21	26.7 ppm
11:00	Initial Bag Vacuum	2 inches H2O	DGM Vac.	2.1 inches H2O	Bag Temp	77 °F	Leak @	Plug

Bag Concentrations (ppmv)

Time	11:29	11:31	11:36
ppmv	12.2	12.1	11.5

Sorbent Tube Sample Collection Parameters

B01A

Time						
11:27	Volume Start	2.9 Liters		Design Sample Flow Rate = 1 liter/min		
11:39	Volume Stop	14.6 Liters	Total Vol	11.7 Liters		
	Sample Run Time	12 Minutes		Sorbent Flow 0.975 L/min	Sorbent $Flow_{STP}$	0.953 L/min

B01B

11:27	Volume Start	3.9 Liters		Design Sample Flow Rate = 1 liter/min		
11:39	Volume Stop	15.5 Liters	Total Vol	11.6 Liters		
	Sample Run Time	12 Minutes		Sorbent Flow 0.967 L/min	Sorbent $Flow_{STP}$	0.945 L/min
	Total ST Vol_{STP}	22.77 Liters	DGM Vol_{STP}	13.10 Liters	Total Run Vol_{STP}	35.88 Liters

Bagging Parameters

Time							
11:31	Vacuum check	0.18 inches H2O			DGM_P	2 inches H2O vacuum	756.7 mmHg
11:31	DGM_{10L} Time	08:56.9 min:sec.frac	DGM Time	8.950	DGM Flow	1.12	DGM $Flow_{STP}$ 1.09 liters/minute
11:31	Bag Temp.	80 °F	26.7 °C		$Sample_T$	80 °F	26.7 °C

Post-Sample Data

11:55	Post Test M21	8-sec Dwell	10.2 ppmv	Total Dwell	4:00 min:sec	Final M21	25.4 ppm

Condensate accumulation: starting time	N/A hour:min	Final time	N/A hour:min	0:00 hours:min
Organic condensate collected	N/A ml			
Density of organic condensate	N/A g/ml			

Average THC emissions =	2.40E-06 kg/hr
Percent difference THC ER =	3.7%
Acceptable?	Yes

Bagging Data Form **Vacuum Method** Sample Id **B03**

Equipment type:	Valve			**Component ID:**	**B-164**		
Equipment Subtype:	GT Valve			**Plant ID:**	Refinery B		
Line Size:	10	*inches*		**Date:**	19-Jul-17		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR		
Barometric pressure	29.92	*inHg*	760.0 *mmHg*	**Sample Pump A**	BU51790		
				Sample Pump B	BU51292		
Ambient Temp:	86.6	°F	30.3 °C	**TVA ID**	2337		
Component Temp:	345	°F	173.9 °C	**Stream Pressure/Temp:**		*psig*	°F
Stream Description:	*Diesel at E-836*						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form	Vacuum Method		Sample Id	B05
Equipment type:	Pump		Component ID:	B-313
Equipment Subtype:			Plant ID:	Refinery B
Line Size:	8 inches		Date:	20-Jul-17
Phase (G, LL, HL):	HL		Analysis team:	EG/DR
Barometric pressure	29.97 inHg	761.2 mmHg	Sample Pump A	BU51790
			Sample Pump B	BU51292
Ambient Temp:	77.2 °F	25.1 °C	TVA ID	2385
Component Temp:	367 °F	186.1 °C	Stream Pressure/Temp:	150 psig / °F
Stream Description:	From 8D-804 Bottoms Vacuum			

WSPA
Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: B010

Equipment type:	Connector		**Component ID:**	B-1318	
Equipment Subtype:	Plug		**Plant ID:**	Refinery B	
Line Size:	1	*inches*	**Date:**	21-Jul-17	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.86 *inHg*	758.4 *mmHg*	**Sample Pump A**	BU51790	
			Sample Pump B	BU51292	
Ambient Temp:	91.3 *°F*	32.9 *°C*	**TVA ID**	2385	
Component Temp:	98.9 *°F*	37.2 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*Diesel Product Feed Thru E701*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: B012

Equipment type:	Pump CP-934	**Component ID:**	B-632
Equipment Subtype:	Plug on Pump Body	**Plant ID:**	Refinery B
Line Size:	8 *inches*	**Date:**	24-Jul-17
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR
Barometric pressure	29.85 *inHg* / 758.2 *mmHg*	**Sample Pump A**	BU51790
		Sample Pump B	BU51292
Ambient Temp:	66.3 °F / 19.1 °C	**TVA ID**	2149
Component Temp:	95 °F / 35.0 °C	**Stream Pressure/Temp:**	82 *psig* / °F
Stream Description:	*Wet Diesel*		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — **Vacuum Method** — **Sample Id** **B015**

WSPA — Western States Petroleum Association

Equipment type:	Flange	**Component ID:**	B-1314
Equipment Subtype:		**Plant ID:**	Refinery B
Line Size:	8 *inches*	**Date:**	25-Jul-17
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR
Barometric pressure	29.85 *inHg* / 758.2 *mmHg*	**Sample Pump A**	BU51790
		Sample Pump B	BU51292
Ambient Temp:	73.7 °F / 23.2 °C	**TVA ID**	2337
Component Temp:	217.5 °F / 103.1 °C	**Stream Pressure/Temp:**	*psig* / °F
Stream Description:	*Dry Diesel*		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
ºF= (F-32)*5/9 ºC
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: B017

WSPA — Western States Petroleum Association

Equipment type:	Connector			**Component ID:**	B-322	
Equipment Subtype:	Plug			**Plant ID:**	Refinery B	
Line Size:	2	*inches*		**Date:**	25-Jul-17	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.86	*inHg*	758.4 *mmHg*	**Sample Pump A**	BU51790	
				Sample Pump B	BU51292	
Ambient Temp:	83.4	*°F*	28.6 *°C*	**TVA ID**	2337	
Component Temp:	97	*°F*	36.1 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*Slop Oil from 8G-811A/B / HUK Return to TPA from E 845*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id B019

Equipment type:	Connector		**Component ID:**	B-286	
Equipment Subtype:	Plug		**Plant ID:**	Refinery B	
Line Size:	2 *inches*		**Date:**	26-Jul-17	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.99 *inHg*	761.7 *mmHg*	**Sample Pump A**	BU51790	
			Sample Pump B	BU51292	
Ambient Temp:	73.6 *°F*	23.1 *°C*	**TVA ID**	2385	
Component Temp:	94 *°F*	34.4 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*HUK Pump Down - (HUK = Heavy Unicrackate)*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method — Sample Id B021

Equipment type:	Pump		**Component ID:**	B-636	
Equipment Subtype:			**Plant ID:**	Refinery B	
Line Size:	10 inches		**Date:**	26-Jul-17	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.96 inHg	761.0 mmHg	**Sample Pump A**	BU51790	
			Sample Pump B	BU51292	
Ambient Temp:	90.2 °F	32.3 °C	**TVA ID**	2385	
Component Temp:	°F	-17.8 °C	**Stream Pressure/Temp:**	-0.15 psig	°F
Stream Description:	*Diesel Transfer*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Bagging Data Form	**Vacuum Method**		**Sample Id**	**B023**		
Equipment type:	Pump G314 B		**Component ID:**	**B-551**		
Equipment Subtype:	pump running		**Plant ID:**	Refinery B		
Line Size:	6 *inches*		**Date:**	27-Jul-17		
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR		
Barometric pressure	29.94 *inHg*	760.5 *mmHg*	**Sample Pump A**	BU51790		
			Sample Pump B	BU51292		
Ambient Temp:	69.3 *°F*	20.7 *°C*	**TVA ID**	2149		
Component Temp:	141 *°F*	60.6 *°C*	**Stream Pressure/Temp:**	235 *psig*	*°F*	
Stream Description:	*Lean Sponge Oil*					

WSPA
Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: B026

Equipment type:	Connector			**Component ID:**	B-270	
Equipment Subtype:	Plug			**Plant ID:**	Refinery B	
Line Size:	1	*inches*		**Date:**	27-Jul-17	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.87 *inHg*	758.7	*mmHg*	**Sample Pump A**	BU51790	
				Sample Pump B	BU51292	
Ambient Temp:	84.2 *°F*	29.0	*°C*	**TVA ID**	2149	
Component Temp:	151 *°F*	66.1	*°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*HUK Pump Down*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: B033

WSPA — Western States Petroleum Association

Equipment type:	Tubing (swagelok) Plug		**Component ID:**	B-1396	
Equipment Subtype:	Plug		**Plant ID:**	Refinery B	
Line Size:	1/4 inches		**Date:**	19-Apr-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.98 inHg	761.5 mmHg	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	84.7 °F	29.3 °C	**TVA ID**	36502	
Component Temp:	85.5 °F	29.7 °C	**Stream Pressure/Temp:**	200 psig	°F
Stream Description:	Non-blended diesel prod. To U76				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form **Vacuum Method** **Sample Id** B036

WSPA Western States Petroleum Association

Equipment type:	Connector		**Component ID:**	B-1094	(tag reads 1099)	
Equipment Subtype:	Cap		**Plant ID:**	Refinery B		
Line Size:	1	*inches*	**Date:**	20-Apr-18		
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR		
Barometric pressure	30.07 *inHg*	763.8 *mmHg*	**Sample Pump A**	LP52979		
			Sample Pump B	LP52975		
Ambient Temp:	70.6 *°F*	21.4 *°C*	**TVA ID**	37887		
Component Temp:	63.3 *°F*	17.4 *°C*	**Stream Pressure/Temp:**	0	*psig*	*°F*
Stream Description:	*Diesel - G721 B Cetane Improver*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id B039

WSPA — Western States Petroleum Association

Equipment type:	Valve		**Component ID:**	**B-1306**	(assumed; no tag/ID)
Equipment Subtype:	Globe		**Plant ID:**	Refinery B	
Line Size:	8	*inches*	**Date:**	20-Apr-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	30.08 *inHg*	764.0 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	85.6 *°F*	29.8 *°C*	**TVA ID**	37887	
Component Temp:	150 *°F*	65.6 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*Diesel to production thru preheat E-701*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id B045

Equipment type:	Valve			**Component ID:**	B-278	
Equipment Subtype:	Bonnet			**Plant ID:**	Refinery B	
Line Size:	6	*inches*		**Date:**	1-May-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.86 *inHg*	758.4	*mmHg*	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	65.6 *°F*	18.7	*°C*	**TVA ID**	37887	
Component Temp:	217 *°F*	102.8	*°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*HUK Heavy Unicrackate*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: B049

WSPA — Western States Petroleum Association

Equipment type:	Pump	**Component ID:**	B-670
Equipment Subtype:	Seal	**Plant ID:**	Refinery B
Line Size:	6 *inches*	**Date:**	2-May-18
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR
Barometric pressure	29.89 *inHg* / 759.2 *mmHg*	**Sample Pump A**	LP52979
		Sample Pump B	LP52975
Ambient Temp:	66.4 *°F* / 19.1 *°C*	**TVA ID**	37887
Component Temp:	105 *°F* / 40.6 *°C*	**Stream Pressure/Temp:**	80 *psig* / *°F*
Stream Description:	*Tank 201 Resid Pump (Pump off)*		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: B052

Equipment type:	Pump		**Component ID:**	B-539	
Equipment Subtype:	Seal		**Plant ID:**	Refinery B	
Line Size:	6 inches		**Date:**	2-May-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.95 inHg	760.7 mmHg	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	73.2 °F	22.9 °C	**TVA ID**	34251	
Component Temp:	67 °F	19.4 °C	**Stream Pressure/Temp:**	210 psig	°F
Stream Description:	Turbine Fuel G605-A (Pump Off)				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Pre-Sample Data

Bagging Data Form	Vacuum Method		Sample Id	B054
Equipment type:	Pump - G809		Component ID:	B-285
Equipment Subtype:	Seal		Plant ID:	Refinery B
Line Size:	8	inches	Date:	3-May-18
Phase (G, LL, HL):	HL		Analysis team:	EG/DR
Barometric pressure	30.18 inHg	766.6 mmHg	Sample Pump A	LP52979
			Sample Pump B	LP52975
Ambient Temp:	77.7 °F	25.4 °C	TVA ID	36502
Component Temp:	229 °F	109.4 °C	Stream Pressure/Temp:	60 psig °F
Stream Description:	TPA/HUK			

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: B056

Equipment type:	Connector	**Component ID:**	B-818
Equipment Subtype:	Plug	**Plant ID:**	Refinery B
Line Size:	1 inches	**Date:**	4-May-18
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR
Barometric pressure	30.14 inHg / 765.6 mmHg	**Sample Pump A**	LP52979
		Sample Pump B	LP52975
Ambient Temp:	62.2 °F / 16.8 °C	**TVA ID**	37887
Component Temp:	79 °F / 26.1 °C	**Stream Pressure/Temp:**	psig / 230 °F
Stream Description:	LCGO		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Pre-Sample Data

Time									
8:55	Background	3 ppmv	8-sec Dwell	2 ppmv	Total Dwell	4:00 min:sec	Final M21	8 ppm
9:25	Initial Bag Vacuum	0.1 inches H2O	DGM Vac.	2 inches H2O	Bag Temp	71.2 °F	Leak @	N side of plug

Bag Concentrations (ppmv)

Time	9:27	9:30	9:32	9:34	9:38	9:43								
ppmv	1.4	1.8	2	2	2.1	1.9								

Sorbent Tube Sample Collection Parameters

B056A

Time						
9:34	Volume Start	687.6 Liters		Design Sample Flow Rate = 1 liter/min		
9:47	Volume Stop	700.0 Liters	Total Vol	12.4 Liters		
	Sample Run Time	13 Minutes	Sorbent Flow	0.954 L/min	$Sorbent Flow_{STP}$	0.971 L/min

B056B

9:34	Volume Start	621.1 Liters		Design Sample Flow Rate = 1 liter/min		
9:47	Volume Stop	633.6 Liters	Total Vol	12.5 Liters		
	Sample Run Time	13 Minutes	Sorbent Flow	0.962 L/min	$Sorbent Flow_{STP}$	0.979 L/min
	$Total ST Vol_{STP}$	25.35 Liters	$DGM Vol_{STP}$	86.30 Liters	$Total Run Vol_{STP}$	111.65 Liters

Bagging Parameters

Time						
9:39	Vacuum check	0.14 inches H2O		DGM_P	2 inches H2O vacuum	761.8 mmHg
9:38	DGM_{10L} Time	01:32.3 min:sec.frac	DGM Time 1.533	DGM Flow	6.52	$DGM Flow_{STP}$ 6.64 liters/minute
9:39	Bag Temp.	74.5 °F	23.6 °C	$Sample_T$	62 °F	16.7 °C

Post-Sample Data

9:57	Post Test M21	Background 0 ppmv	8-sec Dwell	7 ppmv	Total Dwell	2:00 min:sec	Final M21	10.2 ppm @ N side of plug

Condensate accumulation: starting time N/A hour:min — Final time N/A hour:min — 0:00 hours:min
Organic condensate collected N/A ml
Density of organic condensate N/A g/ml

Average THC emissions =	2.29E-06 kg/hr

Bagging Data Form **Vacuum Method** **Sample Id** **B058**

WSPA Western States Petroleum Association

Equipment type:	Pump - G-311		**Component ID:**	B-547	
Equipment Subtype:	Seal		**Plant ID:**	Refinery B	
Line Size:	6 *inches*		**Date:**	4-May-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	30.14 *inHg*	765.6 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	74.8 *°F*	23.8 *°C*	**TVA ID**	34251	
Component Temp:	263 *°F*	128.3 *°C*	**Stream Pressure/Temp:**	>300psig *psig*	*°F*

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Stream Description: *HUK Product (pump On-Water Seal turned off)*

Bagging Data Form — Vacuum Method

Sample Id: B060

Equipment type:	Pump - CP 407			**Component ID:**	B-2040	
Equipment Subtype:	Seal-Inboard			**Plant ID:**	Refinery B	
Line Size:	10 inches			**Date:**	7-May-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.98 inHg	761.5 mmHg		**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	69 °F	20.6 °C		**TVA ID**	37887	
Component Temp:	62 °F	16.7 °C		**Stream Pressure/Temp:**	60 psig	°F
Stream Description:	Mid Barrel (Pump off)					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: B062

WSPA — Western States Petroleum Association

Equipment type:	Pump - CP 407		**Component ID:**	B-2036	
Equipment Subtype:	Outboard Seal		**Plant ID:**	Refinery B	
Line Size:	10 inches		**Date:**	7-May-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.93 inHg	760.2 mmHg	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	86 °F	30.0 °C	**TVA ID**	36502	
Component Temp:	85 °F	29.4 °C	**Stream Pressure/Temp:**	60 psig	°F
Stream Description:	*Mid Barrel (Pump Off)*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id B064

WSPA Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	B-807 (sub for B-821)	
Equipment Subtype:	Gate			**Plant ID:**	Refinery B	
Line Size:	1	inches		**Date:**	8-May-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.99	inHg	761.7 mmHg	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	72.3	°F	22.4 °C	**TVA ID**	37887	
Component Temp:	69	°F	20.6 °C	**Stream Pressure/Temp:**	110 psig	°F
Stream Description:	LCGO @ Pump GM-222					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: B066

WSPA Western States Petroleum Association

Equipment type:	Pump CP 591		**Component ID:**	B-2042	
Equipment Subtype:	Seal		**Plant ID:**	Refinery B	
Line Size:	6 inches		**Date:**	8-May-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	30.06 inHg	763.5 mmHg	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	80.5 °F	26.9 °C	**TVA ID**	34251	
Component Temp:	85 °F	29.4 °C	**Stream Pressure/Temp:**	psig	°F

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Stream Description: *Diesel Blend Pump CP-591 (Pump off)*

Pre-Sample Data

Bagging Data Form — Vacuum Method

Sample Id	**B068**					
Equipment type:	Pump - G105A			**Component ID:**	**B-668**	
Equipment Subtype:	Seal			**Plant ID:**	Refinery B	
Line Size:	6 *inches*			**Date:**	9-May-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.99 *inHg*	761.7 *mmHg*		**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	77 *°F*	25.0 *°C*		**TVA ID**	36502	
Component Temp:	227 *°F*	108.3 *°C*		**Stream Pressure/Temp:**	200 *psig*	*°F*
Stream Description:	*Combined Gas Oil*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Refinery C Sample Results

Bagging Data Form — Vacuum Method

Sample Id C001

WSPA — Western States Petroleum Association

Equipment type:	Valve		**Component ID:**	**401-21862-V**	
Equipment Subtype:	Gate		**Unit:**	Refinery C	
Line Size:	12	*inches*	**Date:**	17-May-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	30.02 *inHg*	762.5 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	79.6 *°F*	26.4 *°C*	**TVA ID**	37887	
Component Temp:	267 *°F*	130.6 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*Draw Stripper Tar*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form **Vacuum Method** **Sample Id** **C007**

Equipment type:	Valve		**Component ID:**	**21210**	
Equipment Subtype:	Gate		**Unit:**	Refinery C	
Line Size:	2 *inches*		**Date:**	18-May-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.98 *inHg*	761.5 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	66.8 *°F*	19.3 *°C*	**TVA ID**	36502	
Component Temp:	82 *°F*	27.8 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*DAO to NISO - Wash Oil*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: C009

WSPA Western States Petroleum Association

Equipment type:	Pump (P1169)	**Component ID:**	20145
Equipment Subtype:	Seal	**Unit:**	Refinery C
Line Size:	6 *inches*	**Date:**	21-May-18
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR
Barometric pressure	29.86 *inHg* / 758.4 *mmHg*	**Sample Pump A**	LP52979
		Sample Pump B	LP52975
Ambient Temp:	72.2 °F / 22.3 °C	**TVA ID**	37887
Component Temp:	242 °F / 116.7 °C	**Stream Pressure/Temp:**	240 *psig* / °F
Stream Description:	*Crude Vac SC6 (Pump On)*		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: C011

WSPA Western States Petroleum Association

Equipment type:	Pump (P6703)			**Component ID:**	20085	
Equipment Subtype:	Seal			**Unit:**	Refinery C	
Line Size:	4	*inches*		**Date:**	22-May-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.9 *inHg*	759.5	*mmHg*	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	64.7 °F	18.2	°C	**TVA ID**	36502	
Component Temp:	318 °F	158.9	°C	**Stream Pressure/Temp:**	*psig*	°F
Stream Description:	*Pentamer*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds
STP = 294.15 K & 760 mmHg

Bagging Data Form — Vacuum Method

Sample Id: C013

Equipment type:	Pump		**Component ID:**	20059	
Equipment Subtype:	Seal		**Unit:**	Refinery C	
Line Size:	4 inches		**Date:**	23-May-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.95 inHg	760.7 mmHg	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	62.6 °F	17.0 °C	**TVA ID**	37887	
Component Temp:	92 °F	33.3 °C	**Stream Pressure/Temp:**	175 psig	°F
Stream Description:	*Reflux and Tetramer Product (Pump On)*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds
STP = 294.15 K & 760 mmHg

Bagging Data Form **Vacuum Method** **Sample Id** C016

WSPA Western States Petroleum Association

Equipment type:	Pump (MP1269)			**Component ID:**	20706
Equipment Subtype:	Seal			**Unit:**	Refinery C
Line Size:	4 *inches*			**Date:**	25-May-18
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR
Barometric pressure	30.11 *inHg*	764.8 *mmHg*		**Sample Pump A**	LP52979
				Sample Pump B	LP52975
Ambient Temp:	67.9 *°F*	19.9 *°C*		**TVA ID**	37887
Component Temp:	75 *°F*	23.9 *°C*		**Stream Pressure/Temp:**	*psig* *°F*

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Stream Description: *#5 Sidecut (Pump is Off and has been for 15 yrs per Operator)*

Bagging Data Form	Vacuum Method		Sample Id	C018
Equipment type:	Connector		Component ID:	20402.2
Equipment Subtype:	Flange		Unit:	Refinery C
Line Size:	4 inches		Date:	25-May-18
Phase (G, LL, HL):	HL		Analysis team:	EG/DR
Barometric pressure	30.13 inHg	765.3 mmHg	Sample Pump A	LP52979
			Sample Pump B	LP52975
Ambient Temp:	67.7 °F	19.8 °C	TVA ID	34251
Component Temp:	388 °F	197.8 °C	Stream Pressure/Temp:	psig °F
Stream Description:	TKC Vac btms (asked Ops to turn on CL)			

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: C020

WSPA Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	20252		
Equipment Subtype:	Gate			**Unit:**	Refinery C		
Line Size:	3	*inches*		**Date:**	29-May-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/M		
Barometric pressure	29.83	*inHg*	757.7 *mmHg*	**Sample Pump A**	LP52975		
				Sample Pump B	LP52979		
Ambient Temp:	75.5	°F	24.2 °C	**TVA ID**	37887		
Component Temp:	273	°F	133.9 °C	**Stream Pressure/Temp:**		*psig*	°F
Stream Description:	*Hot Oil Vacuum Feed C1750*						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: C022

WSPA Western States Petroleum Association

Equipment type:	Valve		**Component ID:**	21885	
Equipment Subtype:	Gate		**Unit:**	Refinery C	
Line Size:	12 inches		**Date:**	29-May-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR/MM	
Barometric pressure	29.8 inHg	756.9 mmHg	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	78.3 °F	25.7 °C	**TVA ID**	36502	
Component Temp:	316 °F	157.8 °C	**Stream Pressure/Temp:**	15 psig	°F

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Stream Description: *Tar (had to ventilate bag)*

Bagging Data Form — Vacuum Method

Sample Id C025

WSPA Western States Petroleum Association

Equipment type:	Valve		**Component ID:**	**20464**	
Equipment Subtype:	Gate		**Unit:**	Refinery C	
Line Size:	1	*inches*	**Date:**	30-May-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR/MM	
Barometric pressure	29.81 *inHg*	757.2 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	74.3 °F	23.5 °C	**TVA ID**	37887	
Component Temp:	138 °F	58.9 °C	**Stream Pressure/Temp:**	*psig*	°F
Stream Description:	*Asphalt*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form **Vacuum Method** **Sample Id** C027

WSPA Western States Petroleum Association

Equipment type:	Connector		**Component ID:**	**20522.3**	
Equipment Subtype:	Flange		**Unit:**	Refinery C	
Line Size:	2 *inches*		**Date:**	30-May-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR/MM	
Barometric pressure	29.84 *inHg*	757.9 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	76.4 *°F*	24.7 *°C*	**TVA ID**	37887	
Component Temp:	470 *°F*	243.3 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:					

<u>CONVERSIONS</u>:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: C029

WSPA Western States Petroleum Association

Equipment type:	Valve	**Component ID:**	21210
Equipment Subtype:	Gate	**Unit:**	Refinery C
Line Size:	4 *inches*	**Date:**	30-May-18
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR/MM
Barometric pressure	29.81 *inHg* / 757.2 *mmHg*	**Sample Pump A**	LP52979
		Sample Pump B	LP52975
Ambient Temp:	84.5 *°F* / 29.2 *°C*	**TVA ID**	34251
Component Temp:	92 *°F* / 33.3 *°C*	**Stream Pressure/Temp:**	*psig* / *°F*
Stream Description:	*Wash Oil*		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id	C031				
Equipment type:	Connector	**Component ID:**	21025.3		
Equipment Subtype:	Threaded	**Unit:**	Refinery C		
Line Size:	3/4 *inches*	**Date:**	31-May-18		
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR		
Barometric pressure	29.93 *inHg*	760.2 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	64 °F	17.8 °C	**TVA ID**	37887	
Component Temp:	87 °F	30.6 °C	**Stream Pressure/Temp:**	800 *psig*	°F
Stream Description:	*Charge Oil Fed from SDA Rose PCC BKR IIB at P-102*				

WSPA
Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: C033

WSPA Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	20772		
Equipment Subtype:	Gate			**Unit:**	Refinery C		
Line Size:	3/4	inches		**Date:**	20-Jun-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR		
Barometric pressure	30.02	inHg	762.5 mmHg	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	66.7	°F	19.3 °C	**TVA ID**	37887		
Component Temp:	160	°F	71.1 °C	**Stream Pressure/Temp:**	45	psig	°F
Stream Description:	DAO						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id C035

WSPA Western States Petroleum Association

Equipment type:	PRD		**Component ID:**	20171		
Equipment Subtype:	Side Flange		**Unit:**	Refinery C		
Line Size:	1 *inches*		**Date:**	20-Jun-18		
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR		
Barometric pressure	30.04 *inHg*	763.0 *mmHg*	**Sample Pump A**	LP52979		
			Sample Pump B	LP52975		
Ambient Temp:	75 *°F*	23.9 *°C*	**TVA ID**	36502		
Component Temp:	82 *°F*	27.8 *°C*	**Stream Pressure/Temp:**	280 *psig*		*°F*
Stream Description:	*MEA*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: C037

Equipment type:	Pump (Sample Pump)			**Component ID:**	20067 - P
Equipment Subtype:	Seal			**Unit:**	Refinery C
Line Size:	1 inches			**Date:**	21-Jun-18
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR
Barometric pressure	29.84 inHg	757.9 mmHg		**Sample Pump A**	LP52979
				Sample Pump B	LP52975
Ambient Temp:	56.6 °F	13.7 °C		**TVA ID**	37887
Component Temp:	53.1 °F	11.7 °C		**Stream Pressure/Temp:**	psig °F
Stream Description:	Diesel				

WSPA Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Pre-Sample Data

Time										
8:51	Background	2 ppmv	8-sec Dwell	12 ppmv	Total Dwell	3:00 min:sec	Final M21	21 ppm
9:39	Initial Bag Vacuum	0.04 inches H2O	DGM Vac.	2 inches H2O	Bag Temp	64 °F	Leak @	bottom side of pump seal

Bag Concentrations (ppmv) (had to vent bag)

Bagging Data Form — Vacuum Method

Sample Id: C040

WSPA Western States Petroleum Association

Equipment type:	Sample Pump		**Component ID:**	20370
Equipment Subtype:	Seal		**Unit:**	Refinery C
Line Size:	1 *inches*		**Date:**	21-Jun-18
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR
Barometric pressure	29.88 *inHg*	759.0 *mmHg*	**Sample Pump A**	LP52979
			Sample Pump B	LP52975
Ambient Temp:	74 °F	23.3 °C	**TVA ID**	36502
Component Temp:	76 °F	24.4 °C	**Stream Pressure/Temp:**	*psig* °F
Stream Description:	*Tetramer*			

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Pre-Sample Data

Bagging Data Form	**Vacuum Method**		**Sample Id**	**C043**		
Equipment type:	Connector		**Component ID:**	**20305.6**		
Equipment Subtype:	Plug		**Unit:**	Refinery C		
Line Size:	1 *inches*		**Date:**	22-Jun-18		
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR		
Barometric pressure	29.95 *inHg*	760.7 *mmHg*	**Sample Pump A**	LP52979		
			Sample Pump B	LP52975		
Ambient Temp:	74.4 *°F*	23.6 *°C*	**TVA ID**	37887		
Component Temp:	85 *°F*	29.4 *°C*	**Stream Pressure/Temp:**	140 *psig*	90.00	*°F*
Stream Description:	*Tar*					

WSPA Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id C045

Equipment type:	Connector			**Component ID:**	20305.5		
Equipment Subtype:	Tube Fitting			**Unit:**	Refinery C		
Line Size:	1/2	inches		**Date:**	22-Jun-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR		
Barometric pressure	29.92	inHg	760.0 mmHg	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	85	°F	29.4 °C	**TVA ID**	37887		
Component Temp:	109	°F	42.8 °C	**Stream Pressure/Temp:**	140 psig	132.00	°F
Stream Description:	Tar						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Pre-Sample Data

Bagging Data Form — Vacuum Method

Sample Id: C047

Equipment type:	Agitator			**Component ID:**	**20178-P**		
Equipment Subtype:	Seal			**Unit:**	Refinery C		
Line Size:	24	*inches*		**Date:**	2-Jul-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR		
Barometric pressure	29.86	*inHg*	758.4 *mmHg*	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	61.4	*°F*	16.3 *°C*	**TVA ID**	37887		
Component Temp:	59	*°F*	15.0 *°C*	**Stream Pressure/Temp:**		*psig*	*°F*
Stream Description:	*Diesel*						

WSPA
Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form **Vacuum Method** **Sample Id** **C049**

Equipment type:	Connector			**Component ID:**	**20306.3**		
Equipment Subtype:	Tubing			**Unit:**	Refinery C		
Line Size:	1/2	*inches*		**Date:**	2-Jul-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR		
Barometric pressure	29.97 *inHg*	761.2	*mmHg*	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	81 °F	27.2	°C	**TVA ID**	36502		
Component Temp:	92 °F	33.3	°C	**Stream Pressure/Temp:**	125	*psig*	140.00 °F
Stream Description:	*Tar*						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id C052

WSPA

Equipment type:	Plug		**Component ID:**	**20758.2**	
Equipment Subtype:			**Unit:**	Refinery C	
Line Size:	3/4 *inches*		**Date:**	3-Jul-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.88 *inHg*	759.0 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	73 °F	22.8 °C	**TVA ID**	37887	
Component Temp:	144 °F	62.2 °C	**Stream Pressure/Temp:**	125 *psig*	°F
Stream Description:	*Hot Oil*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: C054

WSPA Western States Petroleum Association

Equipment type:	Connector		**Component ID:**	201822.3		
Equipment Subtype:	Threaded		**Unit:**	Refinery C		
Line Size:	3/8	*inches*	**Date:**	6-Jul-18		
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR		
Barometric pressure	30.13 *inHg*	765.3 *mmHg*	**Sample Pump A**	LP52979		
			Sample Pump B	LP52975		
Ambient Temp:	74.9 *°F*	23.8 *°C*	**TVA ID**	37887		
Component Temp:	240 *°F*	115.6 *°C*	**Stream Pressure/Temp:**		*psig*	*°F*
Stream Description:	*Hot Oil*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: C056

Equipment type:	Valve		**Component ID:**	416-20307-V	
Equipment Subtype:	Control		**Unit:**	Refinery C	
Line Size:	4 inches		**Date:**	11-Jul-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.92 inHg	760.0 mmHg	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	66.1 °F	18.9 °C	**TVA ID**	36502	
Component Temp:	75 °F	23.9 °C	**Stream Pressure/Temp:**	psig	°F
Stream Description:	Btm Circ HC LNHF Vac Btms				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Pre-Sample Data

Bagging Data Form — Vacuum Method

Sample Id C058

WSPA — Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	416-20310-V	
Equipment Subtype:	Gate			**Unit:**	Refinery C	
Line Size:	3/4 *inches*			**Date:**	11-Jul-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.92 *inHg*	760.0 *mmHg*		**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	70.1 *°F*	21.2 *°C*		**TVA ID**	36502	
Component Temp:	77 *°F*	25.0 *°C*		**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*LNHF Vac Btms*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: C060

Equipment type:	Valve	**Component ID:**	420-20376
Equipment Subtype:	Gate	**Unit:**	Refinery C
Line Size:	6 *inches*	**Date:**	11-Jul-18
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR
Barometric pressure	29.87 *inHg* / 758.7 *mmHg*	**Sample Pump A**	LP52979
		Sample Pump B	LP52975
Ambient Temp:	73.4 °F / 23.0 °C	**TVA ID**	34251
Component Temp:	175 °F / 79.4 °C	**Stream Pressure/Temp:**	*psig* / °F
Stream Description:	*TKC Vac*		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id C062

Equipment type:	Connector		**Component ID:**	420-20347.2	
Equipment Subtype:	Plug		**Unit:**	Refinery C	
Line Size:	3/4	inches	**Date:**	11-Jul-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.84 inHg	757.9 mmHg	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	78.6 °F	25.9 °C	**TVA ID**	36502	
Component Temp:	104 °F	40.0 °C	**Stream Pressure/Temp:**	psig	°F
Stream Description:	TKC Vac				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form **Vacuum Method**

Sample Id C064

Equipment type:	Pump		**Component ID:**	162020293-P		
Equipment Subtype:	Seal		**Unit:**	Refinery C		
Line Size:	1	*inches*	**Date:**	12-Jul-18		
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR/PP		
Barometric pressure	29.79 *inHg*	756.7 *mmHg*	**Sample Pump A**	LP52979		
			Sample Pump B	LP52975		
Ambient Temp:	79.6 *°F*	26.4 *°C*	**TVA ID**	36502		
Component Temp:	77 *°F*	25.0 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*	
Stream Description:	*Tetramer*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Refinery D Sample Results

Bagging Data Form — Vacuum Method

Sample Id: D01

WSPA — Western States Petroleum Association

Equipment type:	Connector			**Component ID:**	D-265
Equipment Subtype:	Plug			**Plant ID:**	Refinery D
Line Size:	1/2	*inches*		**Date:**	21-Mar-18
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR
Barometric pressure	29.73 *inHg*	755.1	*mmHg*	**Sample Pump A**	LP52979
				Sample Pump B	LP52975
Ambient Temp:	71 °F	21.7	°C	**TVA ID**	37887
Component Temp:	68.4 °F	20.2	°C	**Stream Pressure/Temp:**	*psig* / °F
Stream Description:	*Bleeder to PIC475 (DSU to Tank 257)*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id	D05				
Equipment type:	Connector	Component ID:	D-690		
Equipment Subtype:	Pipe Union	Plant ID:	Refinery D		
Line Size:	1 inches	Date:	23-Mar-18		
Phase (G, LL, HL):	HL	Analysis team:	EG/DR		
Barometric pressure	30.14 inHg	765.7 mmHg	Sample Pump A	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	60.1 °F	15.6 °C	TVA ID	36502	
Component Temp:	75.38 °F	24.1 °C	Stream Pressure/Temp:	psig	°F
Stream Description:	STAB Bottoms@ Sample Station				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id D07

Equipment type:	Connector			**Component ID:**	D-711		
Equipment Subtype:	Flange			**Plant ID:**	Refinery D		
Line Size:	8	*inches*		**Date:**	23-Mar-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR		
Barometric pressure	30.11 *inHg*	764.7	*mmHg*	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	78.8 °F	26.0	°C	**TVA ID**	36502		
Component Temp:	353 °F	178.3	°C	**Stream Pressure/Temp:**	*psig*		°F
Stream Description:	*V-752 Product to Unit*						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D09

WSPA — Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	D-599	
Equipment Subtype:	Gate			**Plant ID:**	Refinery D	
Line Size:	1	*inches*		**Date:**	26-Mar-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	30.14	*inHg*	765.6 *mmHg*	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	55.1	*°F*	12.8 *°C*	**TVA ID**	37887	
Component Temp:	57	*°F*	13.9 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*Jet*					

CONVERSIONS:
- 1 inch Hg = 25.4 mmHg
- 1 inch H2O column = 1.87 mmHg
- °F= (F-32)*5/9 °C
- 1 m³ = 1000 liters
- 1 kg = 1E+9 µg
- 1 kg = 2.20462 pounds
- 1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D011

WSPA Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	D-601		
Equipment Subtype:	Gate			**Plant ID:**	Refinery D		
Line Size:	6	*inches*		**Date:**	26-Mar-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR		
Barometric pressure	30.13	*inHg*	765.3 *mmHg*	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	62.1	°F	16.7 °C	**TVA ID**	37887		
Component Temp:	80.1	°F	26.7 °C	**Stream Pressure/Temp:**		*psig*	°F
Stream Description:	*Jet*						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id D015

Equipment type:	Valve		**Component ID:**	D-796	
Equipment Subtype:	Plug		**Plant ID:**	Refinery D	
Line Size:	3	*inches*	**Date:**	27-Mar-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	30.17 *inHg*	766.3 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	63.17 *°F*	17.3 *°C*	**TVA ID**	37887	
Component Temp:	58 *°F*	14.4 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*HPHT Tops to Flare*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D017

WSPA — Western States Petroleum Association

Equipment type:	Valve	**Component ID:**	D-713
Equipment Subtype:	Gate	**Plant ID:**	Refinery D
Line Size:	6 *inches*	**Date:**	27-Mar-18
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR
Barometric pressure	30.14 *inHg* 765.6 *mmHg*	**Sample Pump A**	LP52979
		Sample Pump B	LP52975
Ambient Temp:	85.7 *°F* 29.8 *°C*	**TVA ID**	37887
Component Temp:	311 *°F* 155.0 *°C*	**Stream Pressure/Temp:**	*psig* *°F*

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds
STP = 294.15 K & 760 mmHg

Stream Description: *V-752 Inventory Product to Unit/Stab Btms Product*

Bagging Data Form **Vacuum Method** **Sample Id** D019

Equipment type:	Valve			**Component ID:**	D-965		
Equipment Subtype:	Gate			**Plant ID:**	Refinery D		
Line Size:	3/4	*inches*		**Date:**	28-Mar-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/MD		
Barometric pressure	30.11	*inHg*	764.8 *mmHg*	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	74	*°F*	23.3 *°C*	**TVA ID**	36502		
Component Temp:	392	*°F*	200.0 *°C*	**Stream Pressure/Temp:**	250	*psig*	*°F*
Stream Description:	*Jet V-752 Inventory Product to Unit*						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id	D021				
Equipment type:	Valve	**Component ID:**	D-969		
Equipment Subtype:	Gate	**Plant ID:**	Refinery D		
Line Size:	4 *inches*	**Date:**	28-Mar-18		
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR/MD		
Barometric pressure	30.11 *inHg*	764.8 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	77.2 *°F*	25.1 *°C*	**TVA ID**	36502	
Component Temp:	307 *°F*	152.8 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*Reboil from Pump P2945*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D023

WSPA Western States Petroleum Association

Equipment type:	Valve		**Component ID:**	D-979	
Equipment Subtype:	Gate		**Plant ID:**	Refinery D	
Line Size:	4 inches		**Date:**	28-Mar-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR/MD	
Barometric pressure	30.01 inHg	762.3 mmHg	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	83.7 °F	28.7 °C	**TVA ID**	36502	
Component Temp:	315 °F	157.2 °C	**Stream Pressure/Temp:**	240 psig	°F
Stream Description:	*Reboil Pump 2945*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D025

WSPA Western States Petroleum Association

Equipment type:	Connector			**Component ID:**	D-915	
Equipment Subtype:	on PRD			**Plant ID:**	Refinery D	
Line Size:	1	*inches*		**Date:**	29-Mar-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/MD	
Barometric pressure	30.04 *inHg*	763.0	*mmHg*	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	68.4 *°F*	20.2	*°C*	**TVA ID**	37887	
Component Temp:	*°F*	-17.8	*°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*Jet-top of V-754 HPHT Sep*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

WSPA Western States Petroleum Association

Sample Id	D027						
Equipment type:	Valve			**Component ID:**	D-810		
Equipment Subtype:	Gate			**Plant ID:**	Refinery D		
Line Size:	1/2	*inches*		**Date:**	29-Mar-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/MD		
Barometric pressure	30	*inHg*	762.0 *mmHg*	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	93.6	*°F*	34.2 *°C*	**TVA ID**	37887		
Component Temp:	314	*°F*	156.7 *°C*	**Stream Pressure/Temp:**	10	*psig*	*°F*
Stream Description:	*Stabilizer Reboiler Surge Drum*						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Equipment type:	Valve			**Component ID:**	D-192	
Equipment Subtype:	Gate			**Plant ID:**	Refinery D	
Line Size:	6	*inches*		**Date:**	2-Apr-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.78 *inHg*	756.4	*mmHg*	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	83.2 *°F*	28.4	*°C*	**TVA ID**	36502	
Component Temp:	73.1 *°F*	22.8	*°C*	**Stream Pressure/Temp:**	38 *psig*	*°F*
Stream Description:	*Top of V-751*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form **Vacuum Method** Sample Id D032

WSPA Western States Petroleum Association

Equipment type:	Valve		Component ID:	D-499	
Equipment Subtype:	Gate		Plant ID:	Refinery D	
Line Size:	3/4 *inches*		Date:	2-Apr-18	
Phase (G, LL, HL):	HL		Analysis team:	EG/DR	
Barometric pressure	29.77 *inHg*	756.2 *mmHg*	Sample Pump A	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	71.1 *°F*	21.7 *°C*	TVA ID	36502	
Component Temp:	72.7 *°F*	22.6 *°C*	Stream Pressure/Temp:	*psig*	*°F*
Stream Description:	*Top of V-758*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form	Vacuum Method		Sample Id	D034
Equipment type:	Connector		Component ID:	D-596
Equipment Subtype:	Swagelok Nut		Plant ID:	Refinery D
Line Size:	1/2 inches		Date:	2-Apr-18
Phase (G, LL, HL):	HL		Analysis team:	EG/DR/MD
Barometric pressure	29.79 inHg	756.7 mmHg	Sample Pump A	LP52979
			Sample Pump B	LP52975
Ambient Temp:	80.5 °F	26.9 °C	TVA ID	36502
Component Temp:	75.1 °F	23.9 °C	Stream Pressure/Temp:	psig °F
Stream Description:	Jet A Stab btms to Jet/1 Jet Blend			

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D036

WSPA — Western States Petroleum Association

Equipment type:	Connector			**Component ID:**	D-856		
Equipment Subtype:	Flange			**Plant ID:**	Refinery D		
Line Size:	2	*inches*		**Date:**	3-Apr-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR		
Barometric pressure	29.9	*inHg*	759.5 *mmHg*	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	75.9	*°F*	24.4 *°C*	**TVA ID**	37887		
Component Temp:	323	*°F*	161.7 *°C*	**Stream Pressure/Temp:**		*psig*	*°F*
Stream Description:	*Jet to V-16217 RX4*						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id D038

Equipment type:	Valve	**Component ID:**	D-899
Equipment Subtype:	Gate	**Plant ID:**	Refinery D
Line Size:	3 *inches*	**Date:**	3-Apr-18
Phase (G, LL, HL):	HL	**Analysis team:**	DR/EG/RS
Barometric pressure	29.89 *inHg* 759.2 *mmHg*	**Sample Pump A**	LP52979
		Sample Pump B	LP52975
Ambient Temp:	79.4 *°F* 26.3 *°C*	**TVA ID**	37887
Component Temp:	107 *°F* 41.7 *°C*	**Stream Pressure/Temp:**	*psig* *°F*
Stream Description:	*Reboiler Htr Jet*		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D043

WSPA Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	D-952	
Equipment Subtype:	Gate			**Plant ID:**	Refinery D	
Line Size:	3/4	*inches*		**Date:**	4-Apr-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/RS	
Barometric pressure	29.97 *inHg*	761.2	*mmHg*	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	72.8 *°F*	22.7	*°C*	**TVA ID**	34251	
Component Temp:	157 *°F*	69.4	*°C*	**Stream Pressure/Temp:**	13 *psig*	*°F*
Stream Description:	*Stab Reboil Circ @ P-2946*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D045

WSPA Western States Petroleum Association

Equipment type:	Pump		**Component ID:**	D-1016	
Equipment Subtype:	Seal		**Plant ID:**	Refinery D	
Line Size:	3 inches		**Date:**	5-Apr-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR/RS	
Barometric pressure	30.01 inHg	762.3 mmHg	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	61.8 °F	16.6 °C	**TVA ID**	36502	
Component Temp:	252 °F	122.2 °C	**Stream Pressure/Temp:**	14 psig	°F
Stream Description:	P2946 Stab Reboil Circ/ P-2946 Reb Htr Chg (Pump On)				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds
STP = 294.15 K & 760 mmHg

Bagging Data Form	Vacuum Method	Sample Id	D047
Equipment type:	Valve	Component ID:	D-872
Equipment Subtype:	Gate	Plant ID:	Refinery D
Line Size:	2 inches	Date:	5-Apr-18
Phase (G, LL, HL):	HL	Analysis team:	EG/DR/RS
Barometric pressure	29.98 inHg / 761.5 mmHg	Sample Pump A	LP52979
		Sample Pump B	LP52975
Ambient Temp:	82.8 °F / 28.2 °C	TVA ID	36502
Component Temp:	175 °F / 79.4 °C	Stream Pressure/Temp:	psig °F
Stream Description:	Jet		

WSPA Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D050

Equipment type:	Pump			**Component ID:**	D-1367		
Equipment Subtype:	Connector on Pump Housing			**Plant ID:**	Refinery D		
Line Size:	1	*inches*		**Date:**	6-Apr-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/RS		
Barometric pressure	29.88	*inHg*	759.0 *mmHg*	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	73.8	°F	23.2 °C	**TVA ID**	37887		
Component Temp:	489	°F	253.9 °C	**Stream Pressure/Temp:**		*psig*	°F

Stream Description: *Intermediate Reflux Heavy Gas Oil (cleared area from heavy buildup)*

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D052

WSPA — Western States Petroleum Association

Equipment type:	Pump #12627			**Component ID:**	D-1334	
Equipment Subtype:	Housing			**Plant ID:**	Refinery D	
Line Size:	6	*inches*		**Date:**	9-Apr-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/MD	
Barometric pressure	30.02 *inHg*	762.5	*mmHg*	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	80.2 *°F*	26.8	*°C*	**TVA ID**	36502	
Component Temp:	417 *°F*	213.9	*°C*	**Stream Pressure/Temp:**	90 *psig*	*°F*

Stream Description: *Slurry Under Flow from P12627 CV 1216*

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D055

WSPA — Western States Petroleum Association

Equipment type:	Pump			**Component ID:**	D-1218		
Equipment Subtype:	Seal			**Plant ID:**	Refinery D		
Line Size:	2	*inches*		**Date:**	10-Apr-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/RS		
Barometric pressure	30	*inHg*	762.0 *mmHg*	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	72.2	*°F*	22.3 *°C*	**TVA ID**	37887		
Component Temp:	75	*°F*	23.9 *°C*	**Stream Pressure/Temp:**	25	*psig*	*°F*

Stream Description: *P-14654 Reflux to Scot Stripper*

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D058

Equipment type:	Pump	**Component ID:**	D-1919
Equipment Subtype:	Seal	**Plant ID:**	Refinery D
Line Size:	6 inches	**Date:**	11-Apr-18
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR/RS
Barometric pressure	29.86 inHg / 758.4 mmHg	**Sample Pump A**	LP52979
		Sample Pump B	LP52975
Ambient Temp:	67.9 °F / 19.9 °C	**TVA ID**	36502
Component Temp:	59 °F / 15.0 °C	**Stream Pressure/Temp:**	psig / °F
Stream Description:	P2576 310/375 Ex Tk 257		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D060

WSPA

Equipment type:	Pump			**Component ID:**	D-1925	
Equipment Subtype:	Seal			**Plant ID:**	Refinery D	
Line Size:	12	inches		**Date:**	11-Apr-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/RS	
Barometric pressure	30.01	inHg	762.3 mmHg	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	66.2	°F	19.0 °C	**TVA ID**	36502	
Component Temp:	63	°F	17.2 °C	**Stream Pressure/Temp:**	75 psig	°F
Stream Description:	P2709 BAPL #3 Diesel (Pump Off)					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Pre-Sample Data

Time

Bagging Data Form — Vacuum Method

Sample Id D062

Equipment type:	Pump	**Component ID:**	D-1915
Equipment Subtype:	Seal	**Plant ID:**	Refinery D
Line Size:	6 *inches*	**Date:**	12-Apr-18
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR/RS
Barometric pressure	30.13 *inHg* 765.3 *mmHg*	**Sample Pump A**	LP52979
		Sample Pump B	LP52975
Ambient Temp:	69 °F 20.6 °C	**TVA ID**	37887
Component Temp:	49 °F 9.4 °C	**Stream Pressure/Temp:**	*psig* °F
Stream Description:	*P2577 Gas Oil*		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D066

Equipment type:	Pump			**Component ID:**	D-1013	
Equipment Subtype:	Outboard Seal			**Plant ID:**	Refinery D	
Line Size:	8 inches			**Date:**	13-Apr-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/RS	
Barometric pressure	30.3 inHg	769.6 mmHg		**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	85.8 °F	29.9 °C		**TVA ID**	37887	
Component Temp:	96 °F	35.6 °C		**Stream Pressure/Temp:**	50 psig	800 °F
Stream Description:	*P-2944 Aux Lube Oil (Pump Off)*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Pre-Sample Data

Time								
12:09	Background	0 ppmv	8-sec Dwell	13 ppmv	Total Dwell	3:00 min:sec	Final M21	65 ppm
13:29	Initial Bag Vacuum	0.005 inches H2O	DGM Vac.	2 inches H2O	Bag Temp	62.4 °F	Leak @	West Side of Seal

Bag Concentrations (ppmv)

Time	13:33	13:36	13:38	13:40	13:43	13:47	13:50	13:57						
ppmv	26.2	33.1	37.5	37.8	39.4	37.2	37.8	43.1						

Sorbent Tube Sample Collection Parameters

D066A

Time						
13:49	Volume Start	484.6 Liters		Design Sample Flow Rate = 1 liter/min		
14:02	Volume Stop	497.1 Liters	Total Vol	12.5 Liters		
	Sample Run Time	13 Minutes	Sorbent Flow	0.962 L/min	Sorbent Flow$_{STP}$	0.906 L/min

D066B

13:49	Volume Start	420.9 Liters		Design Sample Flow Rate = 1 liter/min		
14:02	Volume Stop	433.5 Liters	Total Vol	12.6 Liters		
	Sample Run Time	13 Minutes	Sorbent Flow	0.969 L/min	Sorbent Flow$_{STP}$	0.913 L/min
	Total ST Vol$_{STP}$	23.66 Liters	DGM Vol$_{STP}$	79.05 Liters	Total Run Vol$_{STP}$	102.70 Liters

Bagging Parameters

Time								
13:53	Vacuum check	0.005 inches H2O			DGM$_P$	1.8 inches H2O vacuum		766.3 mmHg
13:53	DGM$_{10L}$ Time	01:33.3 min:sec.frac	DGM Time	1.550	DGM Flow	6.45	DGM Flow$_{STP}$	6.08 liters/minute
13:54	Bag Temp.	94.3 °F		34.6 °C	Sample$_T$	107 °F		41.7 °C

Post-Sample Data

14:14	Post Test M21	Background -8 ppmv	8-sec Dwell	64 ppmv	Total Dwell	1:30 min:sec	Final M21	122 ppm
							@	West Side of Seal
Condensate accumulation: starting time		N/A hour:min	Final time	N/A hour:min		0:00 hours:min		
Organic condensate collected		N/A ml						
Density of organic condensate		N/A g/ml						

Average THC emissions =	4.84E-05 kg/hr
Percent difference THC ER =	6%
Acceptable?	Yes

Bagging Data Form — Vacuum Method

Sample Id: D068

WSPA — Western States Petroleum Association

Equipment type:	Pump			**Component ID:**	D-1011	
Equipment Subtype:	Seal - Inboard			**Plant ID:**	Refinery D	
Line Size:	3 inches			**Date:**	16-Apr-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/MD	
Barometric pressure	29.93 inHg	760.2 mmHg		**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	66.1 °F	18.9 °C		**TVA ID**	37887	
Component Temp:	57.9 °F	14.4 °C		**Stream Pressure/Temp:**	psig	69 °F
Stream Description:	*Jet P2948 Aux Lube Oil (Pump Off)*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id D070

WSPA Western States Petroleum Association

Equipment type:	Valve		**Component ID:**	D-97		
Equipment Subtype:	Gate		**Plant ID:**	Refinery D		
Line Size:	3	inches	**Date:**	14-Nov-18		
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR		
Barometric pressure	30.19 inHg	766.8 mmHg	**Sample Pump A**	LP52979		
			Sample Pump B	LP52975		
Ambient Temp:	65.1 °F	18.4 °C	**TVA ID**	37887		
Component Temp:	°F	-17.8 °C	**Stream Pressure/Temp:**	psig		°F
Stream Description:	Jet					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
ºF= (F-32)*5/9 ºC
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id D073

WSPA — Western States Petroleum Association

Equipment type:	Connector		**Component ID:**	D-878	
Equipment Subtype:	Union		**Plant ID:**	Refinery D	
Line Size:	3/4	*inches*	**Date:**	15-Nov-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR/RS	
Barometric pressure	30.04 *inHg*	763.0 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	79.8 *°F*	26.6 *°C*	**TVA ID**	36502	
Component Temp:	117 *°F*	47.2 *°C*	**Stream Pressure/Temp:**	7 *psig*	*°F*
Stream Description:	*Jet (1st Deck of V-752)*				

CONVERSIONS:
- 1 inch Hg = 25.4 mmHg
- 1 inch H2O column = 1.87 mmHg
- °F= (F-32)*5/9 °C
- 1 m^3 = 1000 liters
- 1 kg = 1E+9 µg
- 1 kg = 2.20462 pounds
- 1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id D075

Equipment type:	Connector		**Component ID:**	D-27	
Equipment Subtype:	Threaded Connection		**Plant ID:**	Refinery D	
Line Size:	3/4	*inches*	**Date:**	15-Nov-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR/RS	
Barometric pressure	30.03 *inHg*	762.8 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	60.3 *°F*	15.7 *°C*	**TVA ID**	36502	
Component Temp:	*°F*	-17.8 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*

WSPA
Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Stream Description: *Syn Jet Manifold Syn Jet HCU Btms to Jet A Rundown*

Bagging Data Form — Vacuum Method

Sample Id: D077

WSPA Western States Petroleum Association

Equipment type:	Pump 13196			**Component ID:**	D-1883	
Equipment Subtype:	Seal			**Plant ID:**	Refinery D	
Line Size:	1 inches			**Date:**	19-Nov-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/RS	
Barometric pressure	30.09 inHg	764.3 mmHg		**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	58 °F	14.4 °C		**TVA ID**	37887	
Component Temp:	°F	-17.8 °C		**Stream Pressure/Temp:**	psig	°F
Stream Description:	*RS Transmix (0:1)*					

CONVERSIONS:
- 1 inch Hg = 25.4 mmHg
- 1 inch H2O column = 1.87 mmHg
- °F= (F-32)*5/9 °C
- 1 m³ = 1000 liters
- 1 kg = 1E+9 µg
- 1 kg = 2.20462 pounds
- 1 ton = 2,000 pounds

Pre-Sample Data

Time

Bagging Data Form — Vacuum Method

Sample Id: D079

WSPA — Western States Petroleum Association

Equipment type:	Connector			**Component ID:**	D-628	
Equipment Subtype:	Swage Nut			**Plant ID:**	Refinery D	
Line Size:	1/2	*inches*		**Date:**	19-Nov-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/RS	
Barometric pressure	29.98	*inHg*	761.5 *mmHg*	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	72.5	*°F*	22.5 *°C*	**TVA ID**	37887	
Component Temp:	75	*°F*	23.9 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*Diesel - Stab Btms to Carb*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds
STP = 294.15 K & 760 mmHg

Bagging Data Form — Vacuum Method

Sample Id D081

WSPA — Western States Petroleum Association

Equipment type:	Flange		**Component ID:**	D-2269		
Equipment Subtype:			**Plant ID:**	Refinery D		
Line Size:	4	*inches*	**Date:**	20-Nov-18		
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR/MS		
Barometric pressure	29.94 *inHg*	760.5 *mmHg*	**Sample Pump A**	LP52979		
			Sample Pump B	LP52975		
Ambient Temp:	64 *°F*	17.8 *°C*	**TVA ID**	36502		
Component Temp:	215 *°F*	101.7 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*	
Stream Description:	*Gas Oil 4th Level C13910*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id D083

WSPA — Western States Petroleum Association

Equipment type:	Connectors	**Component ID:**	D-862
Equipment Subtype:	Bull Plug	**Plant ID:**	Refinery D
Line Size:	3/4 *inches*	**Date:**	20-Nov-18
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR/RS
Barometric pressure	29.91 *inHg* 759.7 *mmHg*	**Sample Pump A**	LP52979
		Sample Pump B	LP52975
Ambient Temp:	69 *°F* 20.6 *°C*	**TVA ID**	36502
Component Temp:	89 *°F* 31.7 *°C*	**Stream Pressure/Temp:**	*psig* *°F*
Stream Description:	*Jet @ E16194*		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: D085

WSPA — Western States Petroleum Association

Equipment type:	Connector @ P16189		**Component ID:**	D-4	
Equipment Subtype:	Bull Plug		**Plant ID:**	Refinery D	
Line Size:	3/4	*inches*	**Date:**	27-Nov-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR/RS	
Barometric pressure	29.98 *inHg*	761.5 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	61.6 °F	16.4 °C	**TVA ID**	37887	
Component Temp:	81 °F	27.2 °C	**Stream Pressure/Temp:**	1040 *psig*	°F
Stream Description:	*Jet Feed Charge*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form **Vacuum Method** **Sample Id** D087

Equipment type:	Connector			**Component ID:**	D-348		
Equipment Subtype:	Bull Plug			**Plant ID:**	Refinery D		
Line Size:	1	*inches*		**Date:**	28-Nov-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/RS		
Barometric pressure	29.78	*inHg*	756.4 *mmHg*	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	68	*°F*	20.0 *°C*	**TVA ID**	36502		
Component Temp:	143	*°F*	61.7 *°C*	**Stream Pressure/Temp:**		*psig*	*°F*
Stream Description:	*Jet @ E932B*						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id D089

WSPA Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	D-1669	
Equipment Subtype:	Control Valve IV			**Plant ID:**	Refinery D	
Line Size:	10	*inches*		**Date:**	30-Nov-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR/RS	
Barometric pressure	30.01 *inHg*	762.3 *mmHg*		**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	64 *°F*	17.8 *°C*		**TVA ID**	37887	
Component Temp:	219 *°F*	103.9 *°C*		**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*HGO CFH Product Stripper Bottoms from Pumps*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Refinery E Sample Results

Bagging Data Form — Vacuum Method

Sample Id: E001

Equipment type:	Valve (MOV 633)			**Component ID:**	E-542
Equipment Subtype:	Control			**Unit:**	Refinery E
Line Size:	8 inches			**Date:**	6-Aug-18
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR
Barometric pressure	29.91 inHg	759.7 mmHg		**Sample Pump A**	LP52979
				Sample Pump B	LP52975
Ambient Temp:	84 °F	28.9 °C		**TVA ID**	36502
Component Temp:	155 °F	68.3 °C		**Stream Pressure/Temp:**	psig °F
Stream Description:	LAGO Mixed Feed to D-401 Direct				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E003

WSPA — Western States Petroleum Association

Equipment type:	Connector			**Component ID:**	E-33	
Equipment Subtype:	Reducing Union			**Unit:**	Refinery E	
Line Size:	3/4	*inches*		**Date:**	6-Aug-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.86 *inHg*	758.4 *mmHg*		**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	107 °F	41.7 °C		**TVA ID**	34251	
Component Temp:	233 °F	111.7 °C		**Stream Pressure/Temp:**	*psig*	°F
Stream Description:	*Frac Bottoms Discharge P504*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E005

WSPA — Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	E-269	
Equipment Subtype:	Gate			**Unit:**	Refinery E	
Line Size:	10	*inches*		**Date:**	7-Aug-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.81 *inHg*	757.2	*mmHg*	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	72.1 *°F*	22.3	*°C*	**TVA ID**	36502	
Component Temp:	410 *°F*	210.0	*°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*DSL*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E010

WSPA Western States Petroleum Association

Equipment type:	Valve		**Component ID:**	E-2226	
Equipment Subtype:	Globe		**Unit:**	Refinery E	
Line Size:	1 *inches*		**Date:**	8-Aug-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.85 *inHg*	758.2 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	80 °F	26.7 °C	**TVA ID**	36502	
Component Temp:	150 °F	65.6 °C	**Stream Pressure/Temp:**	*psig*	°F
Stream Description:	*Jet JFHF*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form	Vacuum Method	Sample Id	E013
Equipment type:	Valve	Component ID:	E-2244
Equipment Subtype:	Globe	Unit:	Refinery E
Line Size:	1 1/2 inches	Date:	8-Aug-18
Phase (G, LL, HL):	HL	Analysis team:	EG/DR
Barometric pressure	29.81 inHg / 757.2 mmHg	Sample Pump A	LP52979
		Sample Pump B	LP52975
Ambient Temp:	96 °F / 35.6 °C	TVA ID	37887
Component Temp:	212 °F / 100.0 °C	Stream Pressure/Temp:	psig / °F
Stream Description:	Jet		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E016

WSPA — Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	E-295	
Equipment Subtype:	Gate			**Unit:**	Refinery E	
Line Size:	3	*inches*		**Date:**	9-Aug-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.84	*inHg*	757.9 *mmHg*	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	76.5	*°F*	24.7 *°C*	**TVA ID**	34251	
Component Temp:	170	*°F*	76.7 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*DSL*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E018

WSPA Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	E-2114	
Equipment Subtype:	Gate			**Unit:**	Refinery E	
Line Size:	4	*inches*		**Date:**	9-Aug-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.83 *inHg*	757.7	*mmHg*	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	94 *°F*	34.4	*°C*	**TVA ID**	34251	
Component Temp:	278 *°F*	136.7	*°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*Jet*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E021

WSPA Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	E-2204	
Equipment Subtype:	Gate			**Unit:**	Refinery E	
Line Size:	1 1/2	inches		**Date:**	20-Aug-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.81 inHg	757.2 mmHg		**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	87 °F	30.6 °C		**TVA ID**	36502	
Component Temp:	152 °F	66.7 °C		**Stream Pressure/Temp:**	psig	°F
Stream Description:	JFHF Jet Fuel Hydrofiner					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id E025

WSPA

Equipment type:	Valve		**Component ID:**	E-1755	
Equipment Subtype:	Gate		**Unit:**	Refinery E	
Line Size:	2	*inches*	**Date:**	20-Aug-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.79 *inHg*	756.7 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	90.5 °F	32.5 °C	**TVA ID**	37887	
Component Temp:	87 °F	30.6 °C	**Stream Pressure/Temp:**	*psig*	°F
Stream Description:	*Jet low Flow Recycle*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form	Vacuum Method	Sample Id	E027
Equipment type:	Valve	Component ID:	E-2236
Equipment Subtype:	Gate	Unit:	Refinery E
Line Size:	6 inches	Date:	21-Aug-18
Phase (G, LL, HL):	HL	Analysis team:	EG/DR
Barometric pressure	29.88 inHg; 759.0 mmHg	Sample Pump A	LP52979
		Sample Pump B	LP52975
Ambient Temp:	75 °F; 23.9 °C	TVA ID	34251
Component Temp:	280 °F; 137.8 °C	Stream Pressure/Temp:	psig; °F
Stream Description:	Jet to HP		

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E030

WSPA — Western States Petroleum Association

Equipment type:	Connector		**Component ID:**	E-2200		
Equipment Subtype:	Plug		**Unit:**	Refinery E		
Line Size:	3/4	inches	**Date:**	21-Aug-18		
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR		
Barometric pressure	29.87 inHg	758.7 mmHg	**Sample Pump A**	LP52979		
			Sample Pump B	LP52975		
Ambient Temp:	77.8 °F	25.4 °C	**TVA ID**	36502		
Component Temp:	97 °F	36.1 °C	**Stream Pressure/Temp:**		psig	°F
Stream Description:	Jet					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id E033

Equipment type:	Pump			**Component ID:**	E-331	
Equipment Subtype:	Seal - back (farthest from motor)			**Unit:**	Refinery E	
Line Size:	6	inches		**Date:**	22-Aug-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.96 inHg	761.0	mmHg	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	76.8 °F	24.9	°C	**TVA ID**	34251	
Component Temp:	207 °F	97.2	°C	**Stream Pressure/Temp:**	psig	°F
Stream Description:	Jet (Pump On)					

WSPA Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E036

Equipment type:	Valve			**Component ID:**	E-1583		
Equipment Subtype:	Gate			**Unit:**	Refinery E		
Line Size:	3/4	inches		**Date:**	23-Aug-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR		
Barometric pressure	29.97	inHg	761.2 mmHg	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	70.6	°F	21.4 °C	**TVA ID**	37887		
Component Temp:	110	°F	43.3 °C	**Stream Pressure/Temp:**	1900	psig	°F
Stream Description:	Jet Low Flow Recycle						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E038

WSPA

Equipment type:	Valve		**Component ID:**	E-1593
Equipment Subtype:	Gate		**Unit:**	Refinery E
Line Size:	3/4 *inches*		**Date:**	23-Aug-18
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR
Barometric pressure	29.94 *inHg*	760.5 *mmHg*	**Sample Pump A**	LP52979
			Sample Pump B	LP52975
Ambient Temp:	80.8 *°F*	27.1 *°C*	**TVA ID**	36502
Component Temp:	174 *°F*	78.9 *°C*	**Stream Pressure/Temp:**	*psig* *°F*
Stream Description:	*Jet*			

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E040

Equipment type:	PRD		**Component ID:**	E-591	
Equipment Subtype:	SP		**Unit:**	Refinery E	
Line Size:	3/4 *inches*		**Date:**	24-Aug-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.94 *inHg*	760.5 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	74.8 *°F*	23.8 *°C*	**TVA ID**	37887	
Component Temp:	67 *°F*	19.4 *°C*	**Stream Pressure/Temp:**	*psig*	300 *°F*
Stream Description:	*Asphalt*				

WSPA
Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E042

Equipment type:	PRD			**Component ID:**	E-551		
Equipment Subtype:	SP			**Unit:**	Refinery E		
Line Size:	3/4	*inches*		**Date:**	4-Sep-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR		
Barometric pressure	29.85	*inHg*	758.2 *mmHg*	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	68.3	*°F*	20.2	**TVA ID**	34251		
Component Temp:	67	*°F*	19.4 *°C*	**Stream Pressure/Temp:**		*psig*	*°F*
Stream Description:	*Asphalt*						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E044

Equipment type:	Connector			**Component ID:**	E-451		
Equipment Subtype:	P4410 B			**Unit:**	Refinery E		
Line Size:	16	*inches*		**Date:**	4-Sep-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR		
Barometric pressure	29.74	*inHg*	755.4 *mmHg*	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	75	*°F*	23.9 *°C*	**TVA ID**	36502		
Component Temp:		*°F*	-17.8 *°C*	**Stream Pressure/Temp:**	175	*psig*	*°F*
Stream Description:	*HCN (Pump On)*						

WSPA
Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E046

WSPA — Western States Petroleum Association

Equipment type:	PRD			**Component ID:**	E-1845		
Equipment Subtype:	Threaded Connetor			**Unit:**	Refinery E		
Line Size:	1	*inches*		**Date:**	5-Sep-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR		
Barometric pressure	29.93	*inHg*	760.2 *mmHg*	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	61.2	°F	16.2 °C	**TVA ID**	34251		
Component Temp:	62	°F	16.7 °C	**Stream Pressure/Temp:**		*psig*	°F
Stream Description:	*Diesel*						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

WSPA Western States Petroleum Association

Equipment type:	PRD-SV-1749			**Component ID:**	E-1901	
Equipment Subtype:	Threaded Connection			**Unit:**	Refinery E	
Line Size:	3/4 inches			**Date:**	6-Sep-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	30.04 inHg	763.0 mmHg		**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	67.4 °F	19.7 °C		**TVA ID**	34251	
Component Temp:	°F	-17.8 °C		**Stream Pressure/Temp:**	psig	°F
Stream Description:	Jet A					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Pre-Sample Data

Time								
9:23	Background	7.4 ppmv	8-sec Dwell	13 ppmv	Total Dwell	1:30 min:sec	Final M21	46 ppm
10:02	Initial Bag Vacuum	0.075 inches H2O	DGM Vac.	2 inches H2O	Bag Temp	69.3 °F	Leak @	threaded connection

Bag Concentrations (ppmv) (had to vent bag)

Time	10:03	10:05	10:07	10:09	10:11	10:13	10:23
ppmv	9.3	11.1	11.7	11.9	12.1	12.1	12.6

Sorbent Tube Sample Collection Parameters

E050A

Time						
10:13	Volume Start	483.2 Liters		Design Sample Flow Rate = 1 liter/min		
10:26	Volume Stop	495.9 Liters	Total Vol	12.7 Liters		
	Sample Run Time	13 Minutes		Sorbent Flow 0.977 L/min	Sorbent Flow$_{STP}$	0.989 L/min

E050B

10:13	Volume Start	475.4 Liters		Design Sample Flow Rate = 1 liter/min		
10:26	Volume Stop	488.1 Liters	Total Vol	12.7 Liters		
	Sample Run Time	13 Minutes		Sorbent Flow 0.977 L/min	Sorbent Flow$_{STP}$	0.989 L/min
	Total ST Vol$_{STP}$	25.72 Liters	DGM Vol$_{STP}$	78.98 Liters	Total Run Vol$_{STP}$	104.70 Liters

Bagging Parameters

Time								
10:17	Vacuum check	0.07 inches H2O			DGM$_P$	2 inches H2O vacuum		759.3 mmHg
10:17	DGM$_{10L}$ Time	01:39.7 min:sec.frac	DGM Time	1.667	DGM Flow	6.00	DGM Flow$_{STP}$	6.08 liters/minute
10:18	Bag Temp.	70.2 °F	21.2 °C		Sample$_T$	63 °F		17.2 °C

Post-Sample Data

Bagging Data Form — Vacuum Method

Sample Id: E052

Equipment type:	Valve			**Component ID:**	E-1781	
Equipment Subtype:	MOV			**Unit:**	Refinery E	
Line Size:	20 *inches*			**Date:**	6-Sep-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	30 *inHg*	762.0 *mmHg*		**Sample Pump A**	LP52975	
				Sample Pump B	LP52979	
Ambient Temp:	73.4 *°F*	23.0 *°C*		**TVA ID**	36502	
Component Temp:	*°F*	-17.8 *°C*		**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*Jet A*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form **Vacuum Method** **Sample Id** **E054**

Equipment type: Valve **Component ID:** E-1783

Equipment Subtype: Gate **Unit:** Refinery E

Line Size: 20 *inches* **Date:** 7-Sep-18

Phase (G, LL, HL): HL **Analysis team:** EG/DR

Barometric pressure 29.98 *inHg* 761.5 *mmHg* **Sample Pump A** LP52979

Sample Pump B LP52975

Ambient Temp: 67.1 *°F* 19.5 *°C* **TVA ID** 37887

Component Temp: 77 *°F* 25.0 *°C* **Stream Pressure/Temp:** *psig* *°F*

Stream Description: *Jet A*

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E056

WSPA — Western States Petroleum Association

Equipment type:	Valve		**Component ID:**	E-1795	
Equipment Subtype:	Gate		**Unit:**	Refinery E	
Line Size:	3/4	*inches*	**Date:**	3-Oct-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.86 *inHg*	758.4 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	69.5 *°F*	20.8 *°C*	**TVA ID**	36502	
Component Temp:	70 *°F*	21.1 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*JP5 Jet Production*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E058

Equipment type:	Valve			**Component ID:**	E-1813	
Equipment Subtype:	Gate			**Unit:**	Refinery E	
Line Size:	3/4	*inches*		**Date:**	3-Oct-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.79 *inHg*	756.7	*mmHg*	**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	84 *°F*	28.9	*°C*	**TVA ID**	37887	
Component Temp:	78 *°F*	25.6	*°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*Diesel @ Tank 17*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form **Vacuum Method** **Sample Id** **E060**

WSPA Western States Petroleum Association

Equipment type:	Valve		**Component ID:**	E-1855		
Equipment Subtype:	Gate		**Unit:**	Refinery E		
Line Size:	6	*inches*	**Date:**	4-Oct-18		
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR		
Barometric pressure	29.94 *inHg*	760.5 *mmHg*	**Sample Pump A**	LP52979		
			Sample Pump B	LP52975		
Ambient Temp:	69 *°F*	20.6 *°C*	**TVA ID**	37887		
Component Temp:	71 *°F*	21.7 *°C*	**Stream Pressure/Temp:**		*psig*	*°F*
Stream Description:	*Tank 1774 - Diesel*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E062

Equipment type:	Bull Plug			**Component ID:**	E-2200
Equipment Subtype:				**Unit:**	Refinery E
Line Size:	3/4 *inches*			**Date:**	4-Oct-18
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR
Barometric pressure	29.91 *inHg*	759.7 *mmHg*		**Sample Pump A**	LP52979
				Sample Pump B	LP52975
Ambient Temp:	85 *°F*	29.4 *°C*		**TVA ID**	36502
Component Temp:	128 *°F*	53.3 *°C*		**Stream Pressure/Temp:**	*psig* *°F*
Stream Description:	*Jet*				

WSPA Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id E064

WSPA Western States Petroleum Association

Equipment type:	Connector			**Component ID:**	E-382	
Equipment Subtype:	Elbow			**Unit:**	Refinery E	
Line Size:	3/4	*inches*		**Date:**	5-Oct-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	30 *inHg*	762.0	*mmHg*	**Sample Pump A**	LP52975	
				Sample Pump B	LP52979	
Ambient Temp:	68 *°F*	20.0	*°C*	**TVA ID**	36502	
Component Temp:	69 *°F*	20.6	*°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*DSL P503B*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E066

WSPA Western States Petroleum Association

Equipment type:	Connector		**Component ID:**	E-5	
Equipment Subtype:	Plug		**Unit:**	Refinery E	
Line Size:	3/4	*inches*	**Date:**	5-Oct-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.97 *inHg*	761.2 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	80 °F	26.7 °C	**TVA ID**	37887	
Component Temp:	188 °F	86.7 °C	**Stream Pressure/Temp:**	*psig*	°F
Stream Description:	*Frac Bottoms @ P504*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E068

Equipment type:	Valve	**Component ID:**	E-16
Equipment Subtype:	Globe	**Unit:**	Refinery E
Line Size:	2 *inches*	**Date:**	8-Oct-18
Phase (G, LL, HL):	HL	**Analysis team:**	EG/DR
Barometric pressure	29.73 *inHg* / 755.1 *mmHg*	**Sample Pump A**	LP52979
		Sample Pump B	LP52975
Ambient Temp:	85.6 *°F* / 29.8 *°C*	**TVA ID**	36502
Component Temp:	364 *°F* / 184.4 *°C*	**Stream Pressure/Temp:**	*psig* *°F*
Stream Description:	*HCRF*		

WSPA Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form	Vacuum Method	Sample Id	E070
Equipment type:	Connector	Component ID:	E-68
Equipment Subtype:	Bull Plug	Unit:	Refinery E
Line Size:	1 inches	Date:	9-Oct-18
Phase (G, LL, HL):	HL	Analysis team:	EG/DR
Barometric pressure	29.74 inHg / 755.4 mmHg	Sample Pump A	LP52979
		Sample Pump B	LP52975
Ambient Temp:	87.7 °F / 30.9 °C	TVA ID	36502
Component Temp:	148 °F / 64.4 °C	Stream Pressure/Temp:	psig / °F
Stream Description:	LGO to R-402 B		

WSPA
Western States Petroleum Association

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E072

WSPA Western States Petroleum Association

Equipment type:	Valve		**Component ID:**	E-813	
Equipment Subtype:	Gate		**Unit:**	Refinery E	
Line Size:	8 *inches*		**Date:**	5-Nov-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.85 *inHg*	758.2 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	86 *°F*	30.0 *°C*	**TVA ID**	37887	
Component Temp:	317 *°F*	158.3 *°C*	**Stream Pressure/Temp:**	40 *psig*	*°F*
Stream Description:	*MPA to T-903 from E-903*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E074

WSPA — Western States Petroleum Association

Equipment type:	Valve			**Component ID:**	E-1117	
Equipment Subtype:	MOV			**Unit:**	Refinery E	
Line Size:	10 inches			**Date:**	5-Nov-18	
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR	
Barometric pressure	29.81 inHg	757.2 mmHg		**Sample Pump A**	LP52979	
				Sample Pump B	LP52975	
Ambient Temp:	80.2 °F	26.8 °C		**TVA ID**	37887	
Component Temp:	94 °F	34.4 °C		**Stream Pressure/Temp:**	10 psig	°F
Stream Description:	*Sludge*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id E076

WSPA Western States Petroleum Association

Equipment type:	Valve		**Component ID:**	E-3	
Equipment Subtype:	Gate		**Unit:**	Refinery E	
Line Size:	3/4 *inches*		**Date:**	6-Nov-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.93 *inHg*	760.2 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	77 *°F*	25.0 *°C*	**TVA ID**	37887	
Component Temp:	170 *°F*	76.7 *°C*	**Stream Pressure/Temp:**	40 *psig*	*°F*

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Stream Description: *Frac Bottoms P504 Suction from T502 bottoms*

Bagging Data Form — Vacuum Method

Sample Id: E078

WSPA Western States Petroleum Association

Equipment type:	Valve		**Component ID:**	E-444	
Equipment Subtype:	Gate		**Unit:**	Refinery E	
Line Size:	3	*inches*	**Date:**	6-Nov-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.89 *inHg*	759.2 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	80.5 *°F*	26.9 *°C*	**TVA ID**	36502	
Component Temp:	136 *°F*	57.8 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*LCCO P/S LAGO to Unit*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E080

WSPA Western States Petroleum Association

Equipment type:	Connector		**Component ID:**	E-556		
Equipment Subtype:	Reducing Union		**Unit:**	Refinery E		
Line Size:	3/4	*inches*	**Date:**	7-Nov-18		
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR		
Barometric pressure	29.98 *inHg*	761.5 *mmHg*	**Sample Pump A**	LP52979		
			Sample Pump B	LP52975		
Ambient Temp:	74 *°F*	23.3 *°C*	**TVA ID**	36502		
Component Temp:	93 *°F*	33.9 *°C*	**Stream Pressure/Temp:**	48	*psig*	*°F*
Stream Description:	*LCCO to Tk 1712*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m^3 = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form **Vacuum Method**

Sample Id E082

Equipment type:	Valve			**Component ID:**	E-536		
Equipment Subtype:	Gate			**Unit:**	Refinery E		
Line Size:	2	*inches*		**Date:**	7-Nov-18		
Phase (G, LL, HL):	HL			**Analysis team:**	EG/DR		
Barometric pressure	29.93 *inHg*	760.2	*mmHg*	**Sample Pump A**	LP52979		
				Sample Pump B	LP52975		
Ambient Temp:	82.6 °F	28.1	°C	**TVA ID**	36502		
Component Temp:	95 °F	35.0	°C	**Stream Pressure/Temp:**		*psig*	°F
Stream Description:	*LAGO Mixed Feed to D-401 Direct*						

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E085

Equipment type:	Valve		**Component ID:**	E-1517	
Equipment Subtype:	Gate		**Unit:**	Refinery E	
Line Size:	6 inches		**Date:**	8-Nov-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	29.98 inHg	761.5 mmHg	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	78 °F	25.6 °C	**TVA ID**	37887	
Component Temp:	°F	-17.8 °C	**Stream Pressure/Temp:**	82 psig	°F
Stream Description:	Diesel from E101				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id	E089					
Equipment type:	Connector		**Component ID:**	E-55		
Equipment Subtype:	Bull Plug		**Unit:**	Refinery E		
Line Size:	3/4	inches	**Date:**	9-Nov-18		
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR		
Barometric pressure	30.06 inHg	763.5 mmHg	**Sample Pump A**	LP52979		
			Sample Pump B	LP52975		
Ambient Temp:	76 °F	24.4 °C	**TVA ID**	36502		
Component Temp:	126 °F	52.2 °C	**Stream Pressure/Temp:**	2200	psig	°F
Stream Description:	HCRF					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id: E091

WSPA — Western States Petroleum Association

Equipment type:	Connector		**Component ID:**	E-22	
Equipment Subtype:	Bull Plug		**Unit:**	Refinery E	
Line Size:	1 *inches*		**Date:**	9-Nov-18	
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR	
Barometric pressure	30.03 *inHg*	762.8 *mmHg*	**Sample Pump A**	LP52979	
			Sample Pump B	LP52975	
Ambient Temp:	72.8 *°F*	22.7 *°C*	**TVA ID**	36502	
Component Temp:	135 *°F*	57.2 *°C*	**Stream Pressure/Temp:**	*psig*	*°F*
Stream Description:	*HCRF Recycle Feed*				

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

Bagging Data Form — Vacuum Method

Sample Id E093

WSPA Western States Petroleum Association

Equipment type:	Valve		**Component ID:**	E-514		
Equipment Subtype:	Gate		**Unit:**	Refinery E		
Line Size:	4	*inches*	**Date:**	12-Nov-18		
Phase (G, LL, HL):	HL		**Analysis team:**	EG/DR		
Barometric pressure	30.25 *inHg*	768.4 *mmHg*	**Sample Pump A**	LP52979		
			Sample Pump B	LP52975		
Ambient Temp:	64 °F	17.8 °C	**TVA ID**	37887		
Component Temp:	145 °F	62.8 °C	**Stream Pressure/Temp:**	*psig*	°F	
Stream Description:	*KLGO T-96 Matanel to HCU Feed Diversion*					

CONVERSIONS:
1 inch Hg = 25.4 mmHg
1 inch H2O column = 1.87 mmHg
°F= (F-32)*5/9 °C
1 m³ = 1000 liters
1 kg = 1E+9 µg
1 kg = 2.20462 pounds
1 ton = 2,000 pounds

APPENDIX C
Quality Assurance and Quality Control Details

APPENDIX C-1
Quality Assurance and Quality Control Procedures

Screening

TVA Calibration and Drift Check Audit Form

Name: ____________ Facility: ____________________
Date: ____________ Calibration Techs: ____________________
Time: ____________ ____________________

Calibration

TVA # ____________
Start Time: ____________
End Time: ____________

(Please explain checkboxes marked "No" in notes section)

	Yes	No
Was zero gas* calibration performed?	☐	☐
Was 5-point calibration performed**? 10ppm ☐ 100ppm ☐ 500ppm ☐ 3000ppm ☐ 10,000ppm ☐	☐	☐
Was a span Check performed? 0ppm ☐ 10ppm ☐ 100ppm ☐ 500ppm ☐ 3000ppm ☐ 10,000ppm ☐	☐	☐
Were measured calibration values within 10% accuracy (25% for 10ppm)?	☐	☐
Was instrument deployed with same probe as calibrated?	☐	☐

* Zero gas has a specification of <0.2ppm hydrocarbon and valid expiration date? **Yes** ☐ **No** ☐

Calibration gases were used with the valid span, accuracy, and expiration date? **Yes ☐ **No** ☐

Drift Check

TVA # ____________
Start Time: ____________
End Time: ____________

(Please explain checkboxes marked "No" in notes section)

	Yes	No	N/A
Was a drift check performed using all calibration gases and zero gas? 0ppm ☐ 10ppm ☐ 100ppm ☐ 500ppm ☐ 3000ppm ☐ 10,000ppm ☐	☐	☐	
Was drift check measurement and calibration value calculation within the 10% accuracy specification?	☐	☐	
Was instrument drift checked with same probe as deployed?	☐	☐	
Were filters changed and was the probe cleaned?	☐	☐	
Was the instrument re-calibrated before being re-deployed?	☐	☐	☐

Notes/Comments:

HLS Field Audit Form

Date: **Facility:** **Auditor:**

	Yes	No
Did you observe the tech changing their background? (note: this should not be done)		
Did you observe them checking filters and/or cleaning their probe?		
Does the tech monitor each component per Method 21 and the HLS Protocol?		
Does the tech monitor every leak point on each component?		
Does the tech display proper monitoring pace?		
Does the tech watch the display of the handheld while monitoring, looking for deflections?		
Does the tech stay on readings for an adequate time period?		
If a leak is found does the tech process the leak and leak tag properly?		
Does the tech place the probe tip at the correct angle to the leak point to find maximum concentration?		
Does the tech fill out the data sheet correctly and legibly?		
Does the tech choose which components are to be screened correctly?		
Does the tech swap out TVA's as required by the protocol?		

Please explain any discrepancies for Air District follow up below:

APPENDIX D
Statistical Analyses of Emissions Data

APPENDIX D-1
Statistical Analyses

I. Background

In April 1980, the United States Environmental Protection Agency (EPA) published a report that detailed the results of a study (1980 EPA Study) into the average emission rate of organic compounds from equipment leaks of components handling different streams including components in heavy liquid service.

The 1980 EPA Study screened a sample of components for equipment leaks and then measured mass emissions from a subset (those that had leaks greater than 200 ppmv). From the measured emissions, the 1980 EPA Study derived "correlation equations," i.e., regression equations, to estimate mass emissions from screening values. These equations were then used to estimate emissions from all components that had screening values above 200 ppmv but whose mass emissions were not measured. Components with leaks below 200 ppmv were assumed to have negligible emissions and treated as zero. Once emissions for all study components were estimated, average emissions per component (kg/hour/component) were developed by component type and stream service (gas, light liquid, heavy liquid).

The statistical analyses used in the 1980 EPA Study is outlined in Section 6.0 of Appendix C of the *Assessment of Atmospheric Emissions from Petroleum Refining: Volume 4. Appendices C, D, and E.* April 1980.

In 1993, the Western States Petroleum Association (WSPA) and the American Petroleum Institute (API) carried out a study (1993 Refinery Study) to develop new correlation equations for estimating emissions from components routinely inspected for leaks using portable hydrocarbon leak detectors.

Data from the 1993 Refinery Study was reviewed, and revised correlation equations were derived and published by the CAPCOA in *California Implementation Guidelines for Estimating Mass Emissions of Fugitive Hydrocarbon Leaks at Petroleum Facilities*, dated February 1999.

The 1993 Refinery Study did not develop revised average emission factors for components not screened in a routine leak monitoring program. Therefore, the average emission factors listed in the 1999 CAPCOA document for estimating emissions from non-monitored components are the same as those developed in the 1980 EPA Study.

In collaboration with the Western States Petroleum Association (WSPA) and the five Bay Area petroleum refineries, the Air District undertook a study (Heavy Liquids Study) of the emissions from equipment leaks at components in heavy liquid service at the five Bay Area petroleum refineries.

This appendix discusses some of the statistical analyses conducted for the Heavy Liquids Study and the rationale for the approach used in the analyses.

II. Introduction

The Heavy Liquids Study (or "Study") acquired study data both through *screening* -- measuring organic compound concentrations of equipment leaks from components (pumps, connectors, and valves) and through *bagging* -- measuring mass emissions of organic compounds of a subset of the field screened components. As such, data from the Heavy Liquids Study comprised two data sets: 1) field screening, and 2) bagging. Approximately 10,000 components were screened while less than 200 components were bagged.

In the body of the Heavy Liquids Study report, a component that was bagged is referred to as to as a sample. However, in the context of this appendix, “sample” has the meaning of a statistical sample while “bagged component” or “bag” is used to refer to a component whose emissions was measured through bagging.

As leaks from less than 200 components in the Study had mass emissions measured, mass emissions from most Study components must be estimated from data collected during the field screening. Most of the field screening data that was collected included external temperatures of the components, component type, component size, process unit, component elevation in addition to leak concentration measurements.

From the bagged data, a relationship between two or more covariates may be modeled using regression analysis to estimate mass emissions from components that were screened but not sampled. If the relationship is modeled perfectly (i.e., the model exactly predicts the observed values) and only relies on one variable, then it will have the following form:

$Y = B_0 + B_1X$ [General Regression Equation (where relationship is exact)]

where B_0 and B_1 are parameters

However, if the model is not exact, it will have an error term as follows:

$Y_i = B_0 + B_1X_i + e_i$ [General Regression Equation (where relationship is approximated empirically)]

where B_0 and B_1 are estimated parameters, i = 1, 2, …n=number of bags.

The regression covariates are in effect being calibrated to supplied data (e.g., measurements of bagged samples). If the regression is not exact, there are two terms in the resulting equation: the estimated or predicted term ($B_0 + B_1Xi$ in the above equation) and the error term, e_i. The first term can be thought of as the calibrated measurement.

The error term represents the difference between the approximated value and the actual value and can be thought of as the measurement error. The difference between the approximated value and the observed value is termed a residual, which is an estimate of the actual error.

Study data was examined to derive both the predicted term as well as the error term to estimate emissions from Study components and then to extrapolate estimated emissions from the Study sample to derive average emissions.

Statistical Software and Programs

Study data was analyzed using two standard software programs, Microsoft Excel and Minitab® 17, as well as software programs written in the R language.

Minitab ® 17 is a statistical software package developed by Minitab, LLC that includes built-in programs for employing standard statistical analyses such as regression analysis. The figure below shows an available menu of program options for different types of regression analyses under the “Stat” or statistics selection.

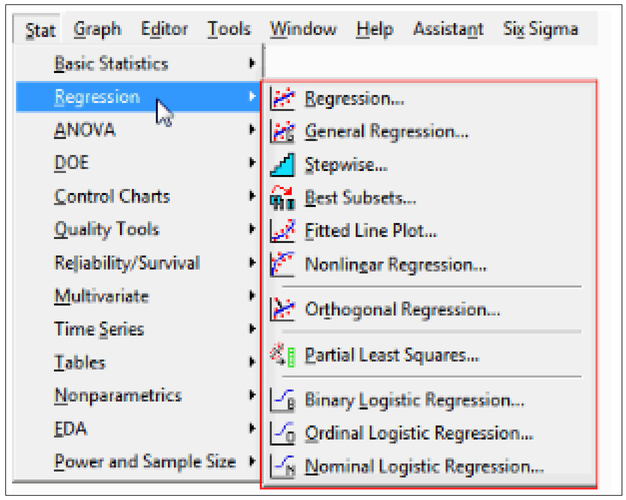

Figure II.1. Minitab 17 menu options for regression analyses

Many of the plots and figures in this appendix were developed in Minitab.

The R programming language is an open-source language that was developed for statistical analyses. Multiple programs and functions were developed for the Study. These programs are included in Appendix D-2.

III. Predicted Term (Regression Analysis)

As part of the Study, each component that was bagged had several variables that were identified and recorded either at the time of screening or at the time of bagging. These variables were either continuous (temperature, pressure, screening value, etc.), discrete (size), or categorical (petroleum refinery, component type, etc.).

The recorded variables included:

- Component Leak Concentration Measurement
- Petroleum Refinery
- Process Unit/Area Category
- Component Type
- Component Sub-Type
- Component Size
- Refinery Stream
- Generalized Stream Service
- Vibration
- Elevation
- Operating Temperature
- Operating Pressure
- Screening Time
- Screening Pace
- Monitor (Air District/Third-Party)
- Screener
- Screening Instrument
- Ambient Temperature
- Ambient Windspeed/Direction

Most variables were determined and recorded directly in the field. However, screening pace was estimated using two other variables: component size (line diameter) and screening time (time spent screening a component).

i. Choice of Data

The data used in any regression analysis not only dictates the choice of regression model that is best suited but also whether any results are meaningful.

Some variables were determined and recorded multiple times for each component. Others were recorded only once at the beginning or end of a screening period.

III.i.1. Dependent Variable (Mass Emissions)

Mass emissions measured from bagging of components was treated as the dependent variable. However, there were several alternatives for computing regression equations using bagged data related to inclusion or exclusion of repeated measurements of the same component (though over different time periods) and inclusion or exclusion of measurements from different parties: the Air District and a third-party (Tricord).

III.i.1.1. Method Detection Limit

A compound may be present at small levels but because of limitations of laboratory equipment and analytical processes may not be detected. The minimum value at which a compound may be detected and reported with 99 percent confidence is termed either the limit of detection (LOD) or the method detection limit (MDL). There are several ways to treat values that are below the MDL.

Prior to initiating the Heavy Liquids Study, a protocol developed for carrying out the study required reporting values at LOD if measured emissions did not exceed the LOD.

However, the method that is often used in emissions inventories is to treat those values as one-half of the MDL unless it can be demonstrated that a particular compound is not expected to be present.

Assuming compounds measured below the LOD as being emitted at the LOD may overestimate emissions. However, assuming such compounds are zero may underestimate emissions. Therefore, unless a compound is not expected to be present in a particular stream, any compounds that were measured below the MDL from a component leak are treated as being emitted at one-half the MDL.

Because ambient atmosphere is not expected to contain C_5 to C_{30} hydrocarbon compounds, the assumption of one-half the MDL is not applied to background measurements.

III.i.1.2. Background Influence

Mass emissions were measured from components using a modified version of the vacuum method outlined in Section 4.2.1 of EPA's *Protocol for Equipment Leak Emission Estimates*, dated November 1995. Specific modifications are discussed in the body of this report in the Methodology Section.

With the vacuum method, a component is enclosed in a tent material and placed under a vacuum. If there is a leak in the enclosure, it may be possible for ambient air to enter. Any hydrocarbons existing in the ambient air could therefore introduce a bias to measured results.

To account for this, the ambient background within selected process units where components were bagged was also tested and had mass emissions measured using the same bagging train and laboratory methods.

Measured results from background were subtracted from measured results of components on a per compound basis (C_5 to C_{24}). The resulting total net mass emissions were used in the regression analysis.

III.i.1.3. Primary and Replicate Bag Results

Components that were bagged had both a primary measurement and replicate measurement taken. Replicate measurements at Refinery A and some at Refinery B were taken sequentially after primary measurements. For the rest, primary and replicate measurements were taken in parallel at the same time.

A comparison of primary measurements with replicate measurements is shown in Figure III.i.1.3.1.

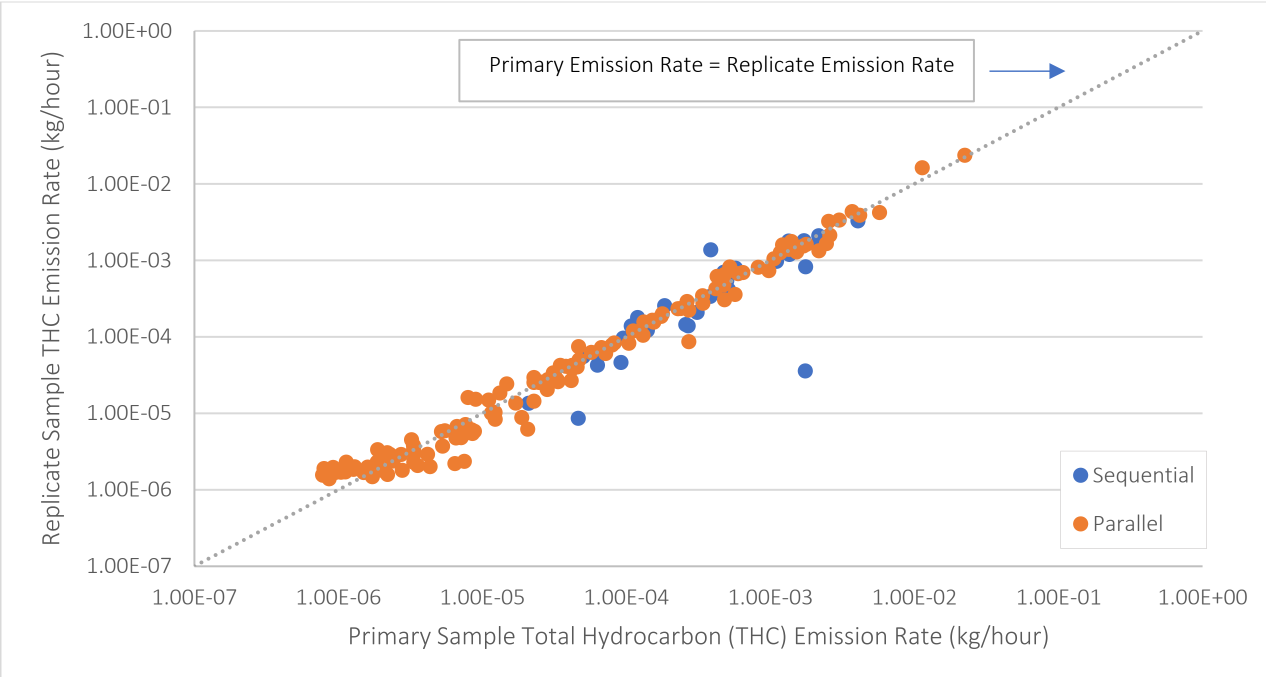

Figure III.i.1.3.1. Primary versus replicate sample results for both sequential and parallel replicate sampling

Except for one point that appears to be an outlier, primary and replicate samples fall within a narrow band. The point that appears to be an outlier represents primary and replicate measurements taken sequentially where approximately 75 minutes elapsed between the primary measurement and replicate measurement.

The field bagging sheet for this component (measurement A09) did not note any anomalies during either primary or replicate measurements. The laboratory report where results of both measurements were provided did not note anything that may explain a difference between the primary and replicate measurements.

Because of the elapsed time, operational changes cannot be ruled out as the cause of the difference between the primary and replicate measurements.

Comparing the percent difference of primary and replicate measurements from the average of both does not indicate any obvious systemic bias as shown in Figure III.i.1.3.2.

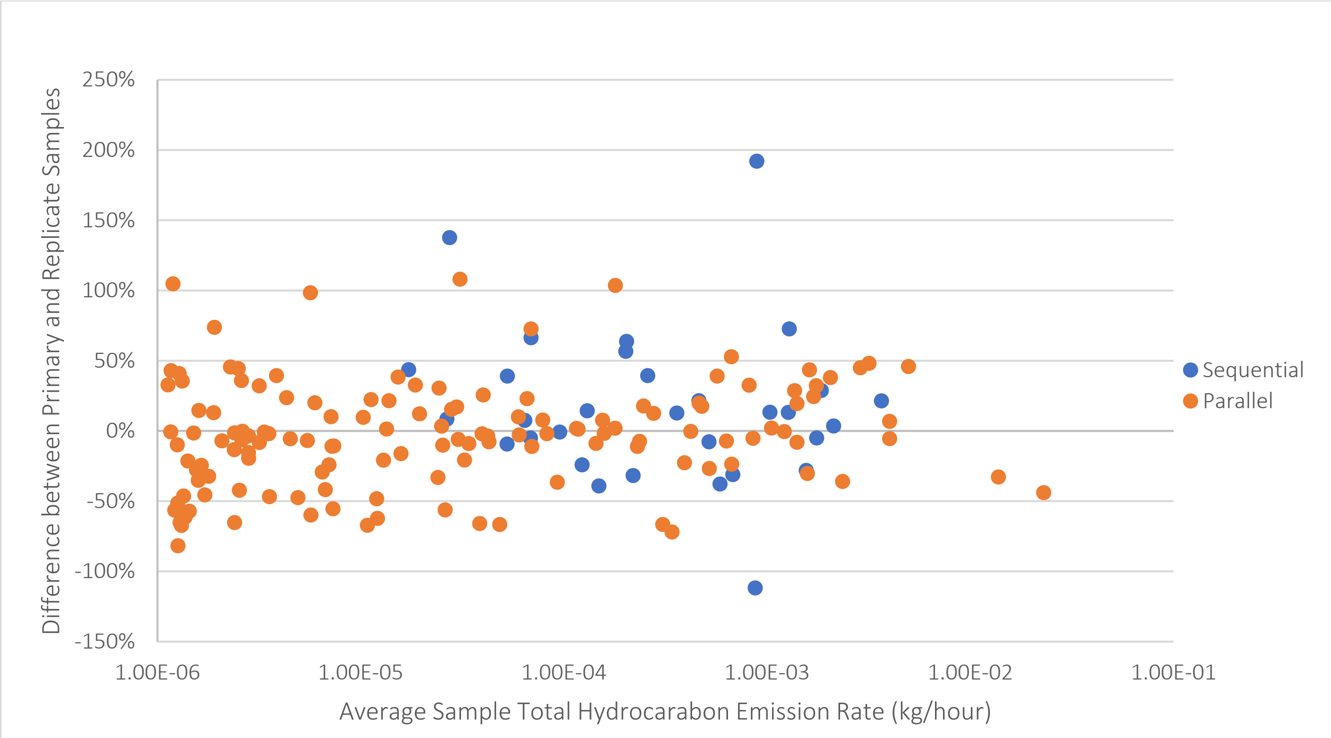

Figure III.i.1.3.2. Average of primary and replicate sample results versus percent differences of primary and replicate samples.

The impact of using either the primary, replicate, or mean of both primary and replicate bag results is discussed in Section VIII.ii. Impact of Bag Measurement Error on Leakage Analysis.

III.i.1.4. Repeated Bagging Results

There were 11 components where repeated measurements were taken (not including replicate measurements). One component (A-1050) was measured four times (each with a primary and replicate measurement) with three and four days in between measurements.

The following figure plots the average of the primary and replicate measurements for each repeated pair against each other.

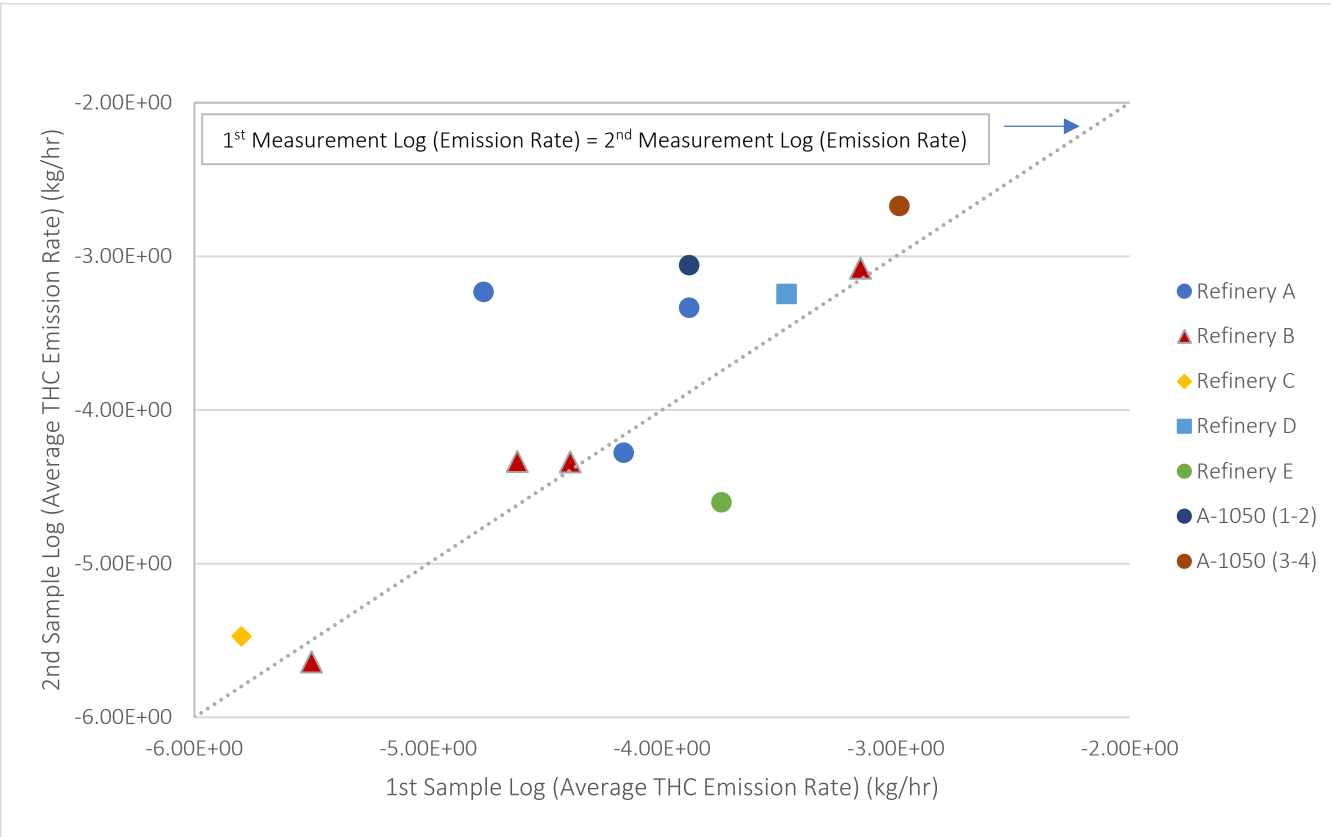

Figure III.i.1.4.1. Comparison of results of repeated measurements

Unlike primary and replicate measurements, there appears to be a trend with repeated measurements: in most cases, the measured emissions of repeated measurements were higher in subsequent measurements. Some of this could be attributed to operational changes. However, the potential impact of bagging on a leak cannot be ruled out.

Unlike repeated screening where disturbance of a leak is minimal, the physical act of bagging a component may have an impact on a leak.

Alternatively, each component that was bagged presented its own challenges to bagging (enclosing and affixing tent materials, space requirements, etc.). As the same personnel were used in bagging components, the ability to bag and measure emissions from the same component may have improved with repeated attempts. If so, the difference in emissions from subsequent measurements could also be attributed to improvements in bagging technique.

III.i.2. Independent Variables

Several recorded variables were evaluated as possible independent variables for regression equations.

III.i.2.1 Screening Value

Both the 1980 EPA Study and the 1993 Refinery Study found relationships between the screening measurement (screening value) and emissions measured through bagging.

Components that were bagged in the Heavy Liquids Study had multiple screening values recorded: during field screening (field screening values), before bagging (pre-bag screening values), and after bagging (post-bag screening values).

In addition, measurements of ambient (background) concentrations near screened or bagged components were recorded during field screening and bagging.

The 1980 EPA Study determined that the logarithms of measured component leak concentrations were highly correlated with the logs of measured component mass emissions, and derived regression equations with the logarithm of leak concentration as the sole covariate.

Through scatterplots, a preliminary review of data in the Heavy Liquids Study indicated, similarly to the 1980 EPA study, that this logarithmic form meets the standard regression assumption of constant variance[1] as well as having a high correlation.

The 1980 EPA Study developed regression equations for each component type that used either the field screening value or the pre-bag screening value as an independent variable. For estimating emissions from valves and pump seals, using pre-bag screening value resulted in equations with greater correlation coefficients (0.78 and 0.68)[2]. In the case of flanges, the regression equation using the field screening value was found to have a greater correlation coefficient (0.74)[2].

Both the field screening value or the pre-bag screening value should represent as found conditions as they were measured either in the initial field screening with minimal interference of the component or prior to preparing a component for bagging, also with minimal interference of the component.

However, post-test screening values may be impacted by preparing the component or the bagging test itself.

A visual examination of the screening values prior to bagging (pre-bag or pre-test) and after bagging (post-test) shows a directional trend as provided in the following figures.

---

[1] This is the assumption that the error variance is constant, independent of the magnitude of the covariate(s).

[2] See Table C6-1 of *Assessment of Atmospheric Emissions from Petroleum Refining: Volume 4. Appendices C, D, and E.* April 1980.

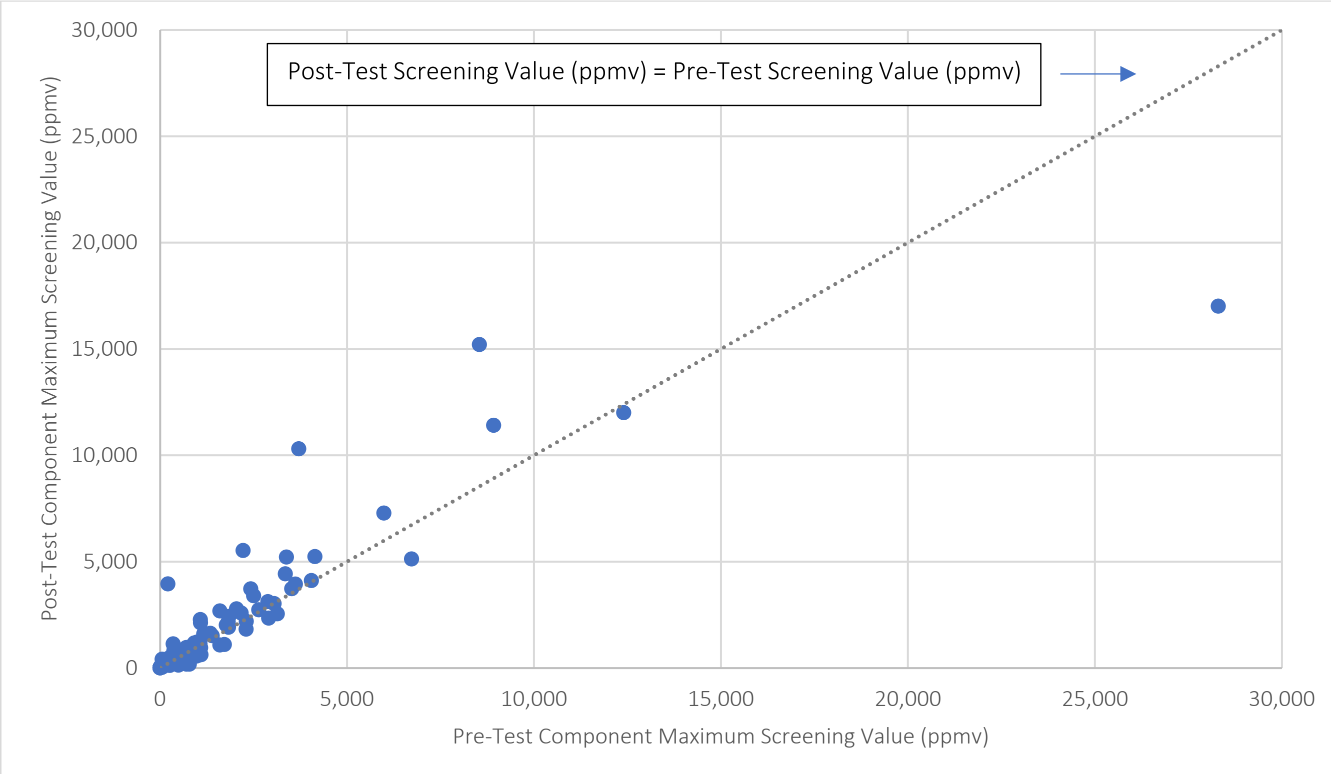

Figure III.i.2.1. Comparison of Pre-test and Post-Test Screening Values (full range)

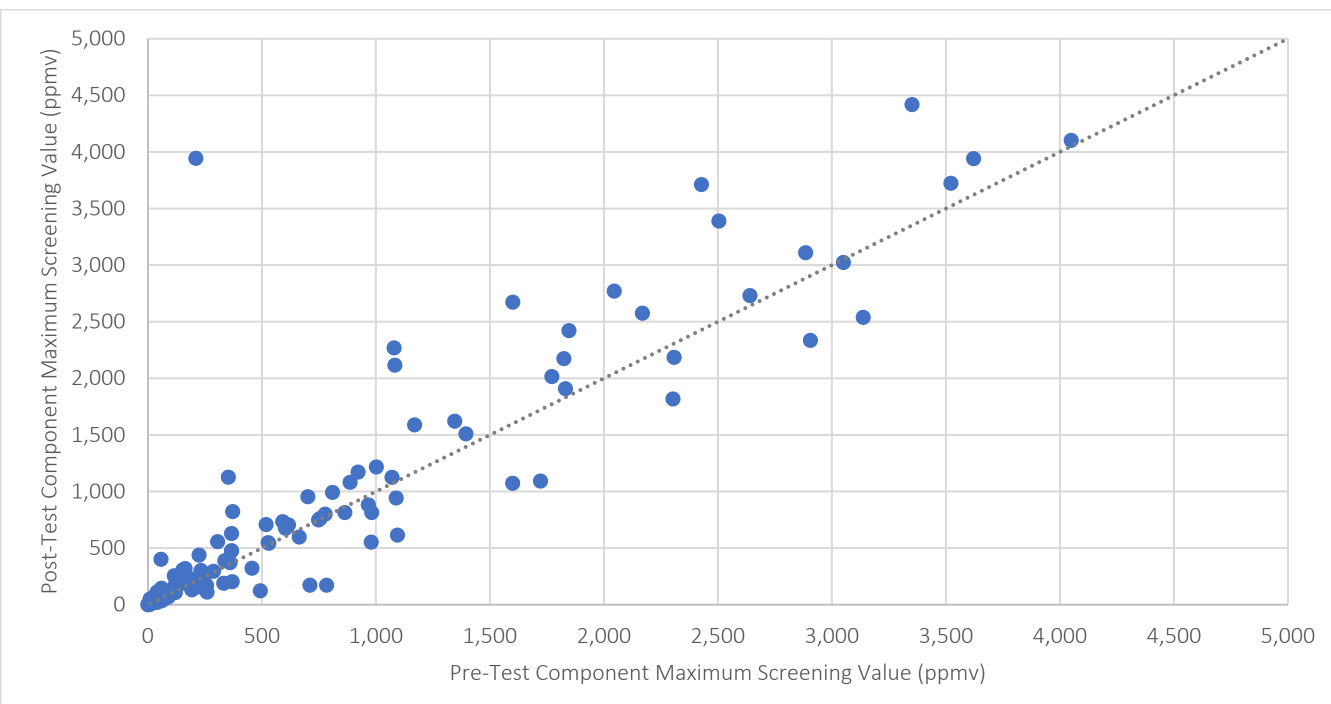

Figure III.i.2.2. Comparison of Pre-Test and Post-Test Screening Values (0 ppm to 5,000 ppm screening values)

As shown in Figure III.i.2.1 and Figure III.i.2.2, the post-test screening values do not match the pre-test screening values and in most cases, the measured post-test screening values were higher than the pre-test screening values. However, the difference between post-test and pre-test screening values are not uniform (expected if there were a systematic bias). Differences between the two measurements may be attributed to process operational changes or to bagging. Therefore, post-test screening values were not used in the analysis.

Regarding field screening values or pre-bag screening values, there were several reasons for using pre-bag screening values.

There were five components that were not included in the field screening portion of the Study and therefore, would be excluded from the regression analysis if field screening values were used.

Pre-bag screening values were taken at the same time or at a minimum the same day as bagging whereas field screening values were measured in some cases almost a year prior to bagging. Because of the elapsed time between when field screening values and bagging occurred, it was likely that the mass emissions may have changed.

Comparing the pre-bag screening values with the field screening values (see Figure III.i.2.3) indicated that emissions from components selected for bagging may have changed since field screening.

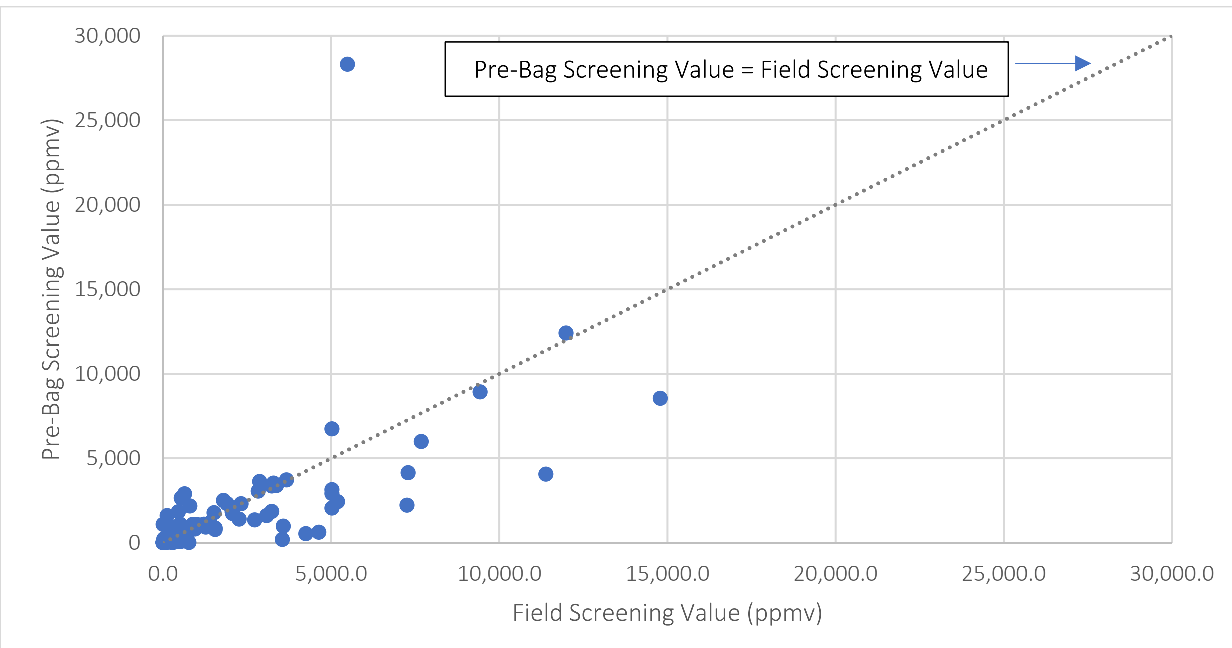

Figure III.i.2.3. Comparison of Pre-Bag Screening Values with Field Screening Values

Because some components may be excluded from the analysis and the likelihood that mass emissions may have differed from the time of field screening and bagging, pre-bag screening values were chosen for the analysis.

In addition, the 1980 EPA Study used the maximum screening values recorded and did not account for background influences on measured screening values. The 1980 EPA Study assumed that components with screening values less than 200 ppmv were negligible. Unless a nearby component were leaking, it is not likely that measuring the ambient background would result in a screening value above 200 ppmv. The regression equations developed in the 1980 EPA Study were for estimating emissions with screening values of 200 ppmv or greater.

However, the 1993 Refinery Study developed correlation equations that used component screening values corrected for the background (subtracting a background screening measurement from a component's maximum screening value, a net screening value).

Per EPA Method 21, followed in leak and inspection programs, measurements of the ambient atmosphere around a component should be taken by randomly moving an instrument probe upwind and downwind of a component at one to two meters from the component or closer (but not closer than 25 centimeters) if there is interference from a nearby leaking component.

Since mass emissions attributed to the ambient atmosphere are subtracted from measured emissions from a component, any ambient concentrations should be subtracted from a component's measured screening value.

In addition to correcting for background, using the net screening value rather than the maximum screen value also solves an issue with negative screening values. When screening instruments are calibrated, field personnel introduce zero air (gas with a known maximum amount of hydrocarbon content) and let the instrument analyze this gas. After a reaching certain point, field personnel will program the instrument to treat the detection reading as zero ppmv. However, if this process occurs too quickly, the "zero" value may be set higher than what the instrument would read if left to continue analyzing the gas. In these cases, an instrument will provide a reading of a negative number when measuring gas with very low hydrocarbon content.

The form of a regression model can be suggested through a visually inspection of a plot (see Figure III.i.2.4) of the bagged values against net screening values.

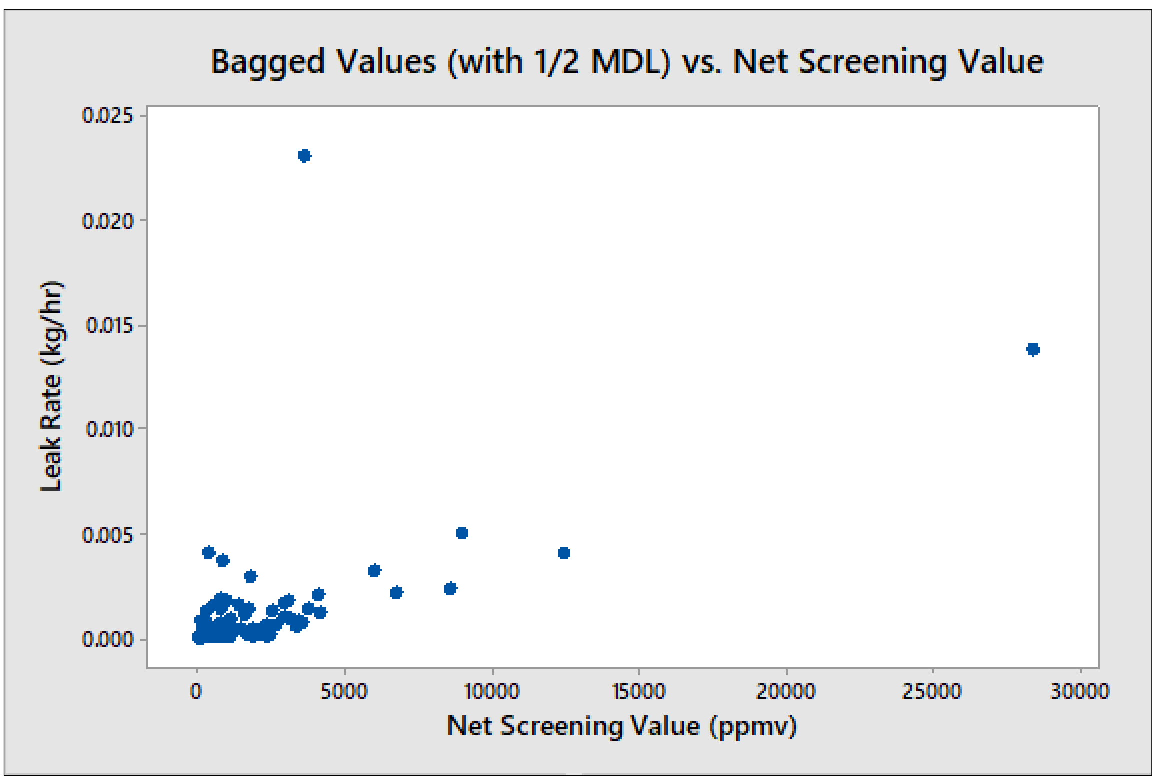

Figure III.i.2.4. Bagged Values versus Net Screening Values

Figure III.i.2.4 shows that the screening value and leak rate (bagged emissions) are both skewed, and in addition appear to vary in proportion to magnitude (the measurement error appears largely multiplicative). Thus, a model of the form:

$B = aS^bE$,

was considered.

Where a and b are coefficients to be estimated, B is the bagged measurement, S is the net screening value, and E represents the error – the part of the bagged measurements not estimable by S alone.

This is a classic model that is linear on the log scale. As with the 1980 EPA Study and the 1993 Refinery Study, the logarithm of the screening value is used in the equation, which creates an additive model on the log scale. The logarithm of base 10 is used as in the previous studies. However, using a different logarithm scale would not change the regression goodness of fit.

However, many components had field screening values at background concentrations so the net screening value would be zero. The logarithm of zero is undefined. This was not a concern for the 1980 EPA Study as the regression equations were developed and used for components with screening values of 200 ppmv or greater. The 1993 Refinery Study developed separate emission factors ("default zero" emission factors) for components that had net screening values of zero and correlation equations were only used for components with a net screening value of 1 ppmv or greater.

In addition, a logarithm transform can give too much weight to small values.

A solution to both issues is to add a small constant, k_a. The smallest non-zero screening value was 1 ppmv and is used as an initial constant value.

However, because the value of k_a is arbitrary, other values were considered. The best correlation of occurred with k_a equal to 10.

The following plots show the result of adding a k_a value of 1 and of 10 to the net screening value when compared against the logarithm of bag measured leak rates.

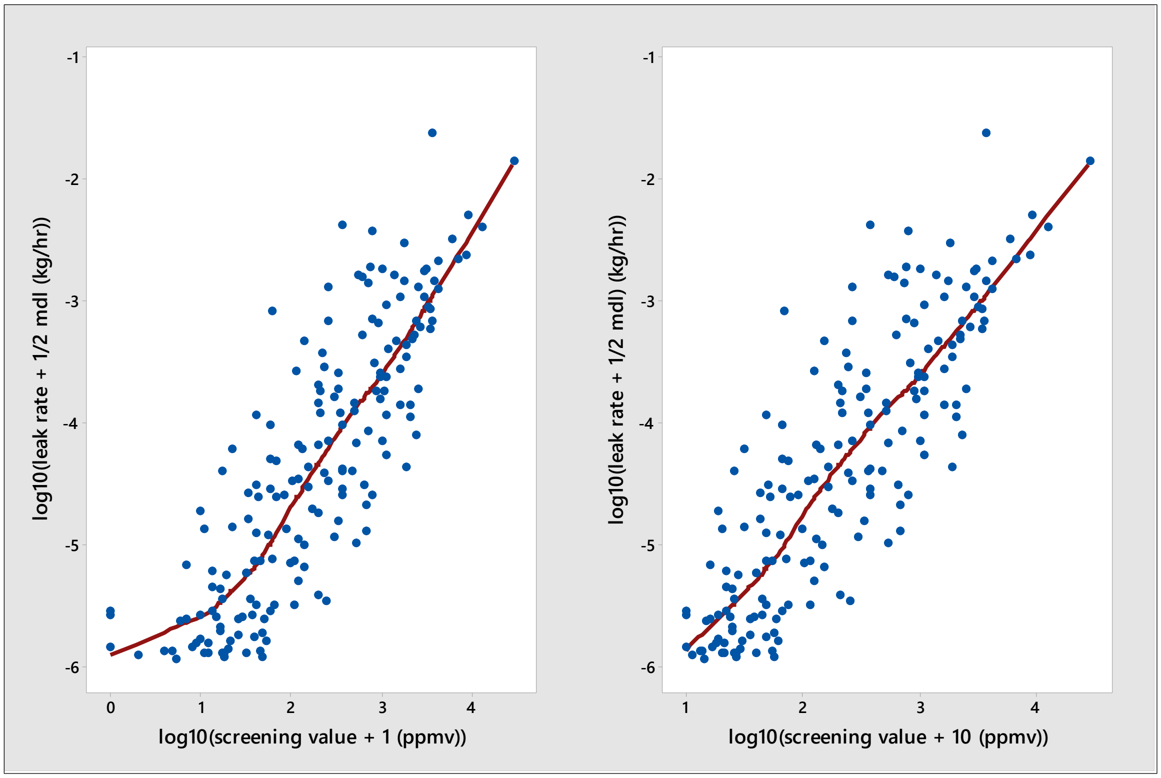

Figure III.i.2.5. Impact of Adding Constant Value (k_a) to Net Screening Value

A smooth curve is drawn showing that the relationship is roughly linear except for small values of S. Note that the smooth curve in the right-hand plot is nearly straight.

Another issue is whether the transformations have corrected the problem of the variation around the regression line increasing with magnitude. Splitting the residuals above and below the median prediction, the ratio of the variance of those above to those below is 1.3. An F-test for equal variances does not reject equality, so the transformation of the leak rate has resulted in an approximately constant variance.

Therefore, an initial model of the form $y = \log_{10}$ (leak rate) and $x_1 = \log_{10}$ (SV + 10) was selected.

III.i.2.1.1 An alternative method for zero net screening values

An alternative to adding a constant to the screening value is to limit the regressions to screening values above a threshold, as was done in the 1980 EPA study. Here the model $y = \log_{10}$ (leak rate) and $x_1' = \log_{10}$ (SV) for SV > 10 ppb was selected, with the estimated leak rate for SV ≤ 10 ppb estimated by the mean of the corresponding bagged values.

In selecting other variables for inclusion in the regression, the model with x_1 was used. In the analysis of leak rates, both models with x_1 and with x_1' were fit, for comparison.

III.i.2.2 Exclusion of observations with screening values ≥ 10,000 ppmv (Pegged values)

Because the highest calibration for screening monitors was 10,000 ppmv, screening values greater than this were not considered reliable to use as regression predictors. Estimation of leakage rates for these components (whose screening values from hereon will be termed pegged values) is discussed below.

III.i.2.1.3 Regression Model Development

Regression Model 1: Basic Model $\log_{10}$(leak rate) versus $\log_{10}$(screening value)

Using the variables y and x_1 as above, a simple linear regression fit yielded:

$y = -7.055 + 1.169\ x_1$. The adjusted R^2 was 72.2%, and the regression standard deviation was 0.58.

III.i.2.2 Temperature

Temperature (of either the component or the stream material) may impact leaks and resulting emission rates in several ways. Components often employ a sealing material where component parts are joined together including sealing gaskets or packing materials. Thermal expansion or contraction of these materials may impact emission rates. In addition, the temperature of process stream material impacts the vapor pressure of the material.

Temperatures were measured when the components were screened (operating temperature) and again right before bagging (bagging temperature).

To understand whether including temperature as an independent variable would improve the regression model, temperature was plotted against the logarithm of the bag measured leak rate as well as the residuals from Model 1 predicted emissions.

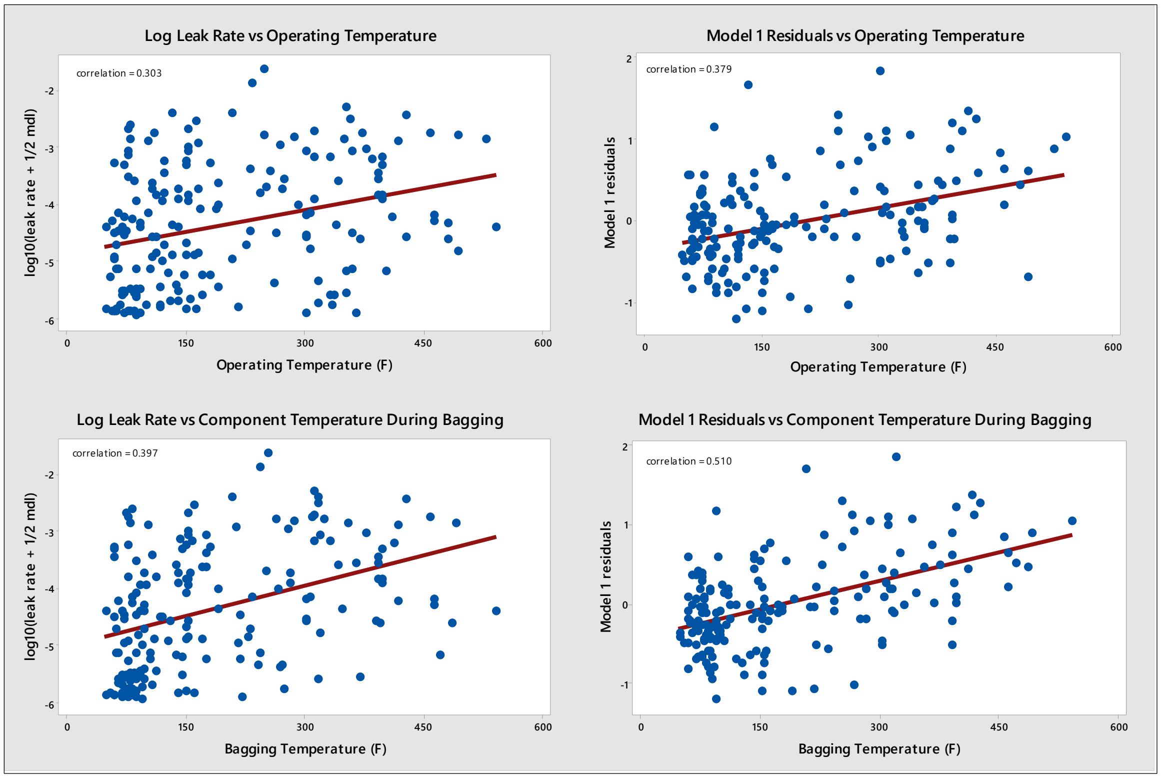

Figure III.i.2.6. Temperature Compared with Measured Leak Rates and Model 1 Residuals

The first column of Figure III.i.2.6 shows plots of log leak rate vs the original temperatures and the pre-bag temperatures. There is a significant correlation for both, with the bagging temperature having a somewhat higher correlation, 0.397 versus 0.303 for the original.

The second column of Figure III.i.2.6 shows the residuals from a regression of log (leak rate) on log(screening), that is, the residuals from Model 1. First note that the correlations are actually higher than the corresponding correlations in the first column. Because of this, temperature appears to add to the prediction based on log screening value. Second, the correlation with the bagging temperatures is again higher than for the original temperatures. This is expected for the same reason that the correlation to pre-bag screening value would be higher than the field screening value: condition or operational changes. The temperature of a component or stream material may differ between the field screening and bagging.

From a visual inspection of the lower right-hand panel of Figure III.i.2.6, the relationship of the residuals to bagging temperature appears roughly linear, so it was chosen as a second covariate below.

Regression Model 2.

Letting x_2 = pre-bag temperature, the regression $y = a + b_1x_1 + b_2x_2$ was fit:

$y = -7.379 + 1.102\ x_1 + 0.00257x_2$. The adjusted R^2 was 80.3% and the regression standard deviation was 0.49.

Both x_1 and x_2 are highly significant. The positive coefficient for temperature indicates that for a given screening value, higher leakage rates are predicted if the component temperature is higher.

Regression Model 3.

As with previous studies, determining whether regression equations differed by component was considered. Figure III.i.2.7 shows that the relation of y to x_1 is quite similar between connectors and valves, less so compared with pumps.

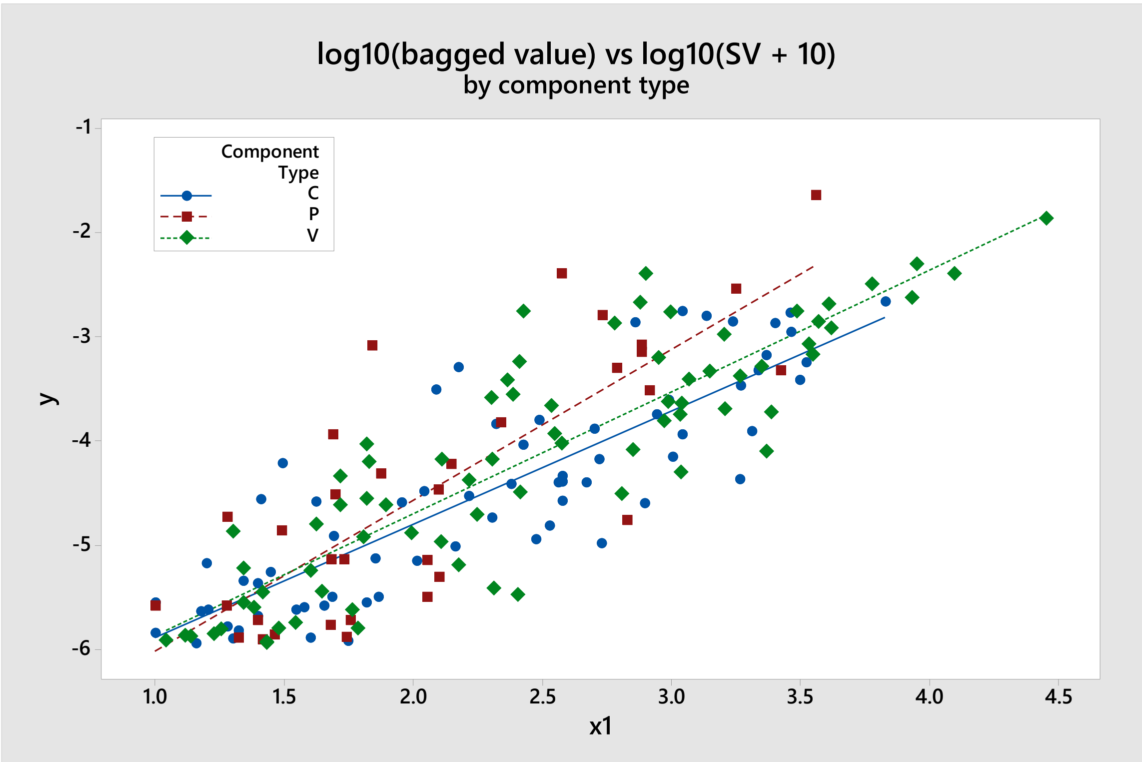

Figure III.i.2.7. Log 10 of leak rate vs log 10 screening value + 10. Regression lines by component also shown.

Model 2 was fit excluding pumps. The fit was y = -7.407 + 1.08 x_1 + 0.0026 x_2, with an adjusted R^2 of 85.1% and a regression sigma of 0.41. To test whether the regression equations were different for connectors and valves, a second model with separate slopes and intercepts was fit. Neither the slopes nor the intercept were statistically significant. An F-test comparing this model and the previous yielded a p-value of 0.45. (F = (sse2-sse1)/3 /mse1, where sse2 is the sum of squared errors from the second model and sse1 is the sum of squared errors from the model with the same slopes and intercept for connectors and valves, so the regression equations are not statistically different. A second issue is whether the uncertainties differed. Fitting connectors and valves separately, the mse's were 0.159 with 66 degrees of freedom and 0.185 with 71 degrees of freedom. F = mse_c/mse_v = 1.16. $P(F_{66,71} > 1.16) = 0.27$, that is, no evidence that the regression sigmas differ. Hence, connectors and valves were assumed to have the same regression model.

The relationship with pumps was then examined. Model 2 was fit including pumps, pooling connectors and valves, but with a separate slope and intercept for pumps.

The differences in the slopes for both x_1 and x_2 were borderline significant, p-values of 0.048 and 0.075. But an F-test revealed that the relationship is quite different. F = (sse2-sse1)/3 / mse1 = 8.18. $P(F_{3,170} > 8.18) = 0$ to five significant digits.

Fitting pumps separately from connectors and valves yields a second difference. For pumps, the MSE equals 0.403 with 30 degrees of freedom. The MSE for the regression with connectors and valves was 0.172 with 140 degrees of freedom. An F-test shows these uncertainties are substantially different: $P(F_{30,140} > 0.403/0.172=2.34) = 0.0005$. Therefore, there is greater uncertainty in the estimation of pump leakage than for connectors and valves. This is also reflected in the adjusted R^2 values, 72.9% for pumps compared with 85.1% for connectors and valves. Thus, separate regressions were fit for pumps and for valves and connectors. The results for Model 3 were:

Valves and Connectors:

$y = -7.407 + 1.083\, x_1 + 0.00261\, x_2$

Term	Coefficient	SE Coeff	t-value	p-value
Intercept	7.407	0.113	-65.4	< 0.0001
x_1	1.083	0.0429	25.3	< 0.0001
x_2	0.00261	0.000273	9.6	< 0.0001

Regression sigma = 0.415
Adjusted R^2 = 85.1%

Pumps

$y = -7.865 + 1.343\, x_1 + 0.00448\, x_2$

Term	Coefficient	SE Coeff	t-value	p-value
Intercept	7.865	0.381	-20.6	< 0.0001
x_1	1.343	0.168	8.0	< 0.0001
x_2	0.00448	0.00137	3.3	0.003

Regression sigma = 0.634
Adjusted R^2 = 72.9%

III.i.2.3 Size for Connectors

Previous studies had suggested that there may be a significant difference in connector emission rates when accounting for size.

This analysis looks at whether including a size variable improves the fit of the regression of y = $\log_{10}$(bagged value) on x_1 = $\log_{10}$(screening value + 10) and x_2 = temperature.

Figure III.i.2.8 shows the relationship between connector size and y=$\log_{10}$(bagged value). A horizontal line shows the mean of y as well as a smoother. The bagged values for the largest sized connectors are above the average.

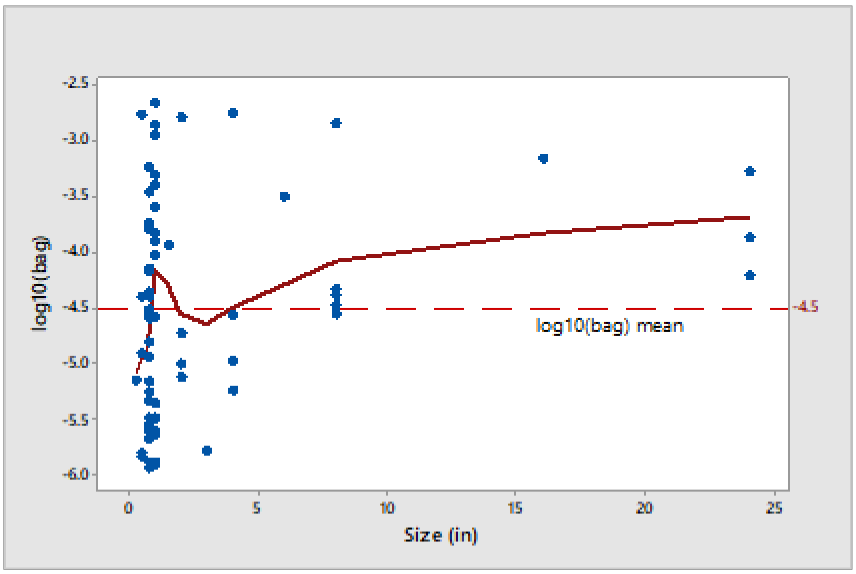

Figure III.i.2.8. Plot of Logarithm of Connector Bagged Sample Results Against Connector Size (Diameter)

The regression of y on x_1 and x_2 limited to the 69 samples of bagged connectors yielded:

y = -7.275 + 1.017*x_1 + 0.0025*x_2, with an adjusted R^2 of 83.6%.

Figure III.i.2.9 shows the residuals from the regression above versus connector size (diameter).

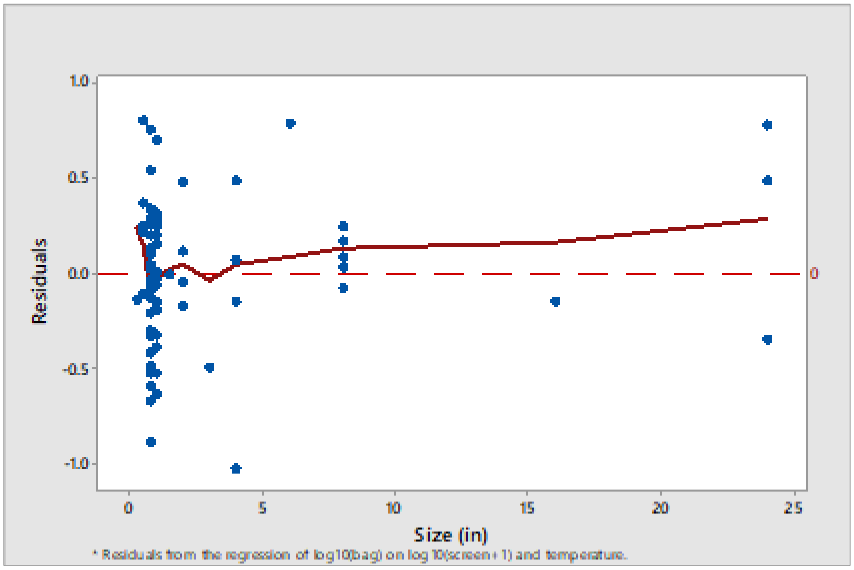

Figure III.i.2.9. Plot of Residuals Against Connector Size (Diameter)

There does appear to be some increase in bagged value even after adjusting for leak rate and temperature.

To test the strength of this relationship, a break-point term was added to the regression: $x_3 = 0$ if Size < z and 1 if Size is > z.

The sizes were in discrete steps as shown in **Table III.i.2-1**. Because of this, the value of z could be chosen as the midpoint between the steps.

Table III.i.2-1. Sizes of Connector Bagged Samples

Size (inches)	Count of Connector Bagged Samples
0.25	1
0.5	5
0.75	26
1	17
1.5	1
2	4
3	1
4	4
6	1
8	5
16	1
24	3

A regression was conducted with a model of $y = b_0 + b_1{*}x_1 + b_2{*}x_2 + b_3{*}x_3$

Regressions were done for every midpoint from z = (0.25 + 0.5)/2 = 0.375 to z = (16 + 24)/2 = 20.

The following table lists the results.

Table III.i.2-2. Break-Point Regression Coefficients and Uncertainties

Break-Point z between Sizes		Regression Results				
Lower Bound	Upper Bound	Size Variable (x_3) coefficient	Std Error	t-Value	p-Value	Adjusted R^2
0.25	0.50	0.147	0.407	0.363	0.718	83.1
0.50	0.75	-0.263	0.174	-1.508	0.132	83.7
0.75	1.0	0.060	0.111	0.542	0.589	83.2
1.0	1.5	0.098	0.117	0.835	0.407	83.3
1.5	2.0	0.105	0.121	0.872	0.387	83.3
2	3	0.096	0.138	0.696	0.489	83.2
3	4	0.159	0.139	1.146	0.256	83.4
4	6	0.282	0.149	1.893	0.063	84.0
6	8	0.178	0.155	1.142	0.258	83.4
8	16	0.235	0.223	1.053	0.296	83.4
16	24	0.369	0.253	1.460	0.149	83.6

From the results, only the breakpoint between 4 inches and 6 inches was close to being statistically significant.

The adjusted R^2 increased a small amount, from 83.6% to 84.0%. Even this small increase may overstate the true effect, since this value was selected as the best among 11 break-points. Therefore, size was not included in the regression equations.

III.i.2.4 Other Continuous Variables

Including other continuous variables into Model 3 was explored by plotting the continuous variables against the residuals from the model, along with adding the variables to Model 3.

Below is a scatterplot for bagging dwell time (the time it took to reach maximum screening value), screening speed (or screening pace), and operating pressure.

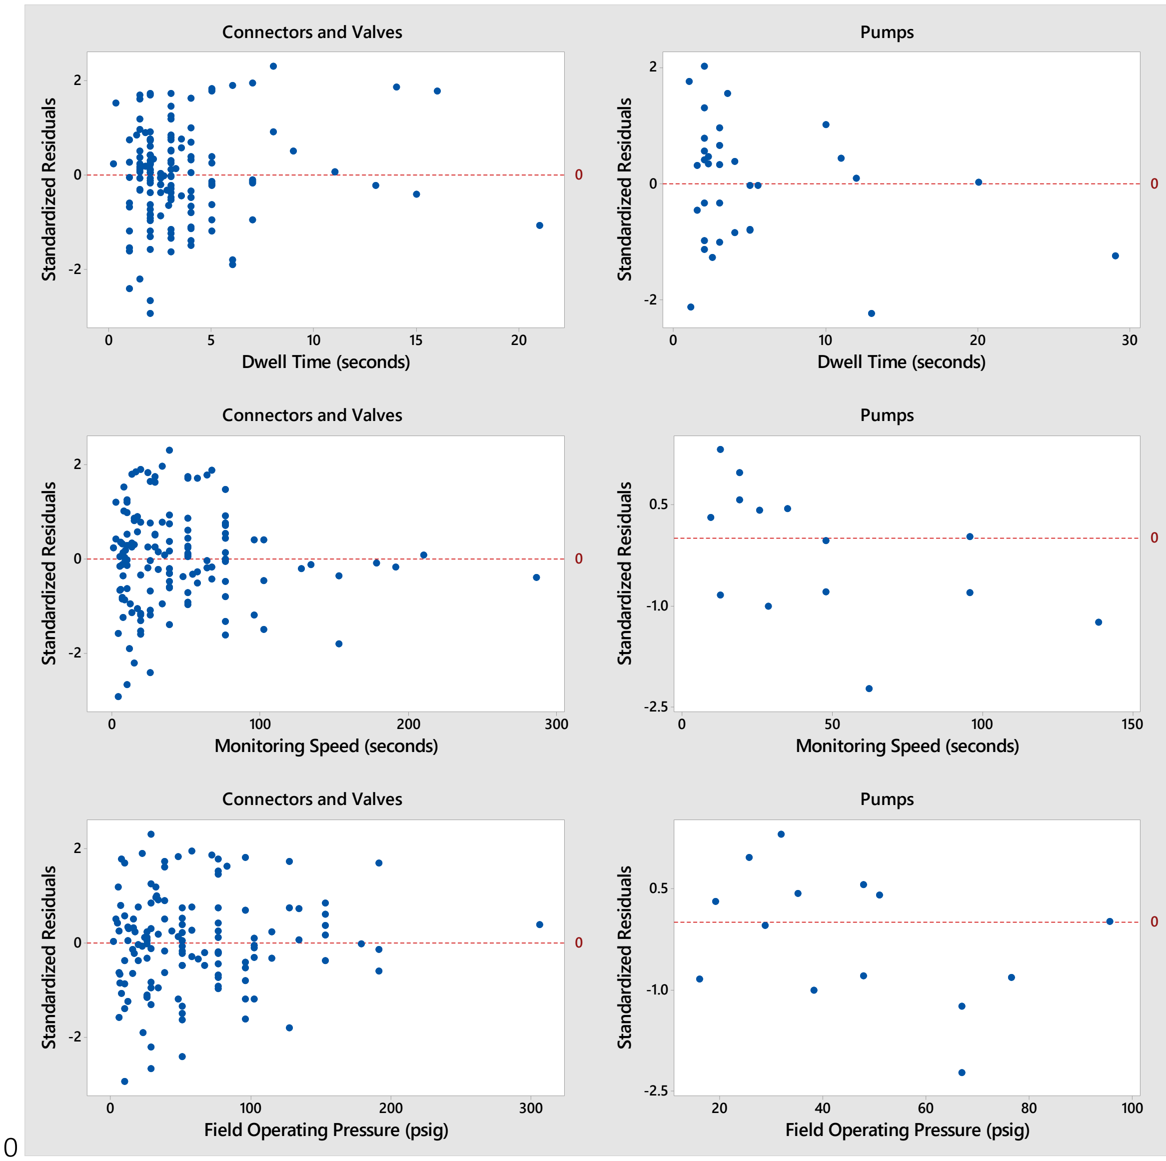

Figure III.i.2.10. Scatterplots of Other Continuous Variables Against Model Residuals

Table III.i.2-3. Coefficients of Variables Added to Model 3

Variable	Connectors and Valves				Pumps			
	n	coeff	s.e.	p-value	n	coeff	s.e.	p-value
Dwell Time	142	0.0166	0.0125	0.189	33	-0.030	0.020	0.143
Monitoring Speed	141	-0.00030	0.0008	0.72	14	-0.0075	0.0045	0.130
Field Operating Pressure	137	0.00086	0.00075	0.25	14	-0.013	0.008	0.145

From , there is little apparent correlation between Model 3 residuals and dwell time, screening speed or operating pressure; Table III.i.2.10 shows that none of these variables were statistically significant when added to Model 3. So these variables were not included in the model.

Other Categorical Variables

Apart from component type, the potential impact of other categorical variables on the regression model was explored.

Process Stream Service

Bagged components were handling different process streams (asphalt, diesel, gas oil, etc.). Stream service terms were added to Model 3 for connectors and valves. Although the adjusted R^2 increased slightly, by 0.3%, to 85.4%, the terms did not improve the fit significantly.

Figure III.i.2.11 shows the coefficients from Model 3 fitted without an intercept. That is, these coefficients are the intercepts for each of the stream services fit with common slopes for x_1 and x_2. Error bars representing one standard error and number of observations per service are also shown. Although the coefficients represent a range on the original scale of a factor of 8, $1x10^{-8}$ to $10^{-7.1}$=$7.9x10^{-8}$, the differences are not statistically significant.

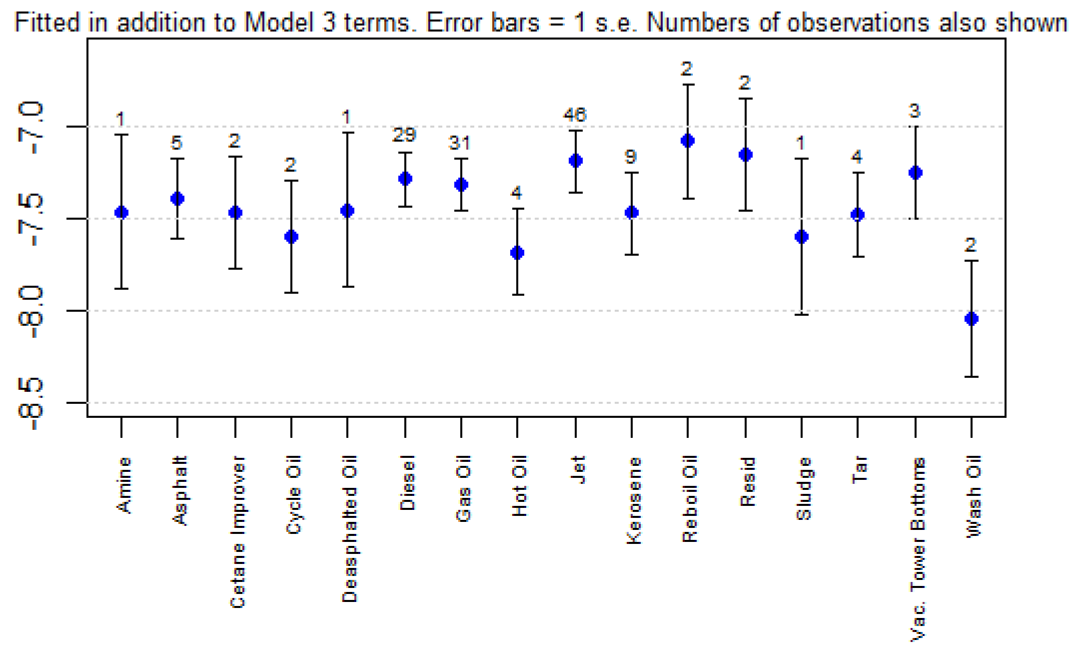

Figure III.i.2.11. Stream Service Coefficients

To test for interactions with screening value or temperature, data was limited to those streams with at least five observations to avoid overfitting. Figure III.i.2.11 shows $\log_{10}$(leak rate) versus $\log_{10}$(screening value) (y vs. x_1) by stream service, along with individual regression lines. Adding interaction terms between streaming service and x_1 did not improve the fit.

Adding interactions with bagging temperature (x_2) did, however. The adjusted R^2 increased from 83.4% to 84.2%. Asphalt was less sensitive to temperature than the other streams. Nevertheless, because the improvement in fit was marginal, stream service interactions were not added to the model.

For pumps, adding 9 different streams to Model 3 results in 12 independent variables with only 33 observations, with only 1 observation for some streams, so there is serious risk of overfitting. Although there is a substantial increase in goodness of fit, it is unclear whether the statistical inference that the stream services are substantially different is legitimate. Therefore, streaming service was not added to the pumps model.

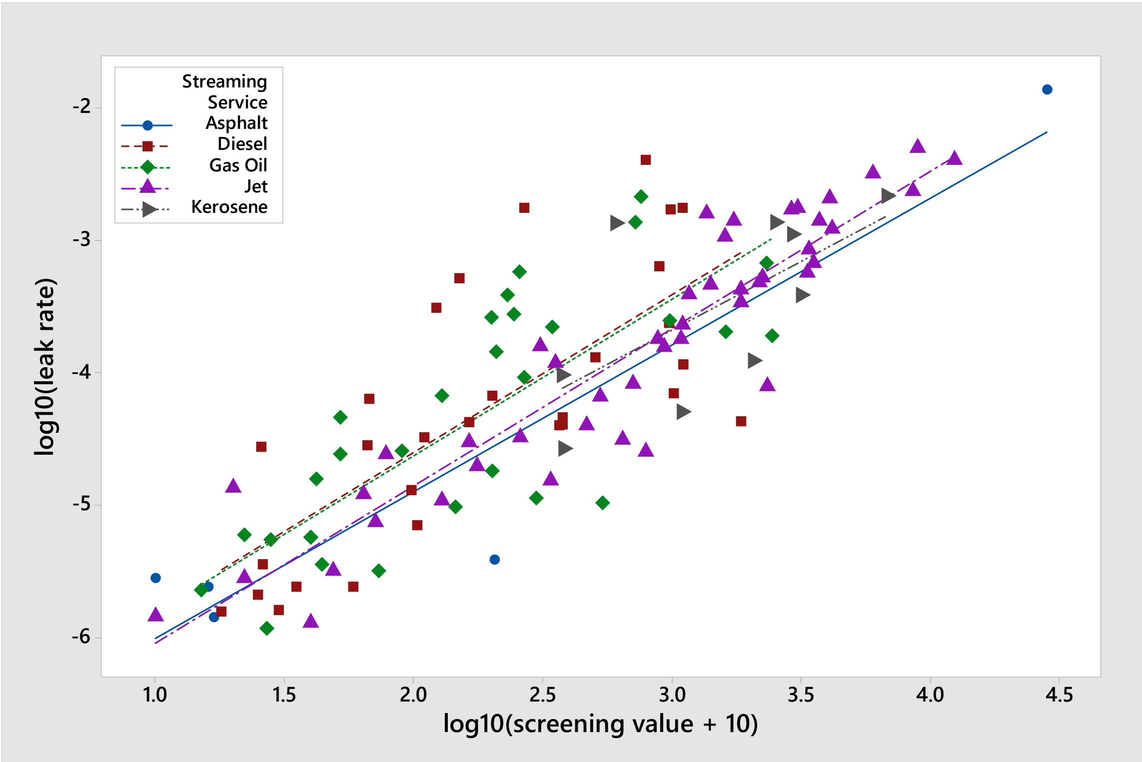

Figure III.i.2.12. Leak Rate versus Screening Value by Stream Service (for streaming services with at least five observations)

Generalized Process Unit / Area

As with process stream service, terms were added to Model 3 for Generalized Process Unit / Area. For connectors and valves, the differences among them are marginally significant (p-value = 0.016). Figure III.i.2.12 shows the differences, which range as much as a factor of 5 ($\log_{10}(5) \approx 0.7$). The increase in adjusted-R^2 was 1.3%, from 85.1% to 86.4%. For pumps, the "Other" category was statistically significant, but without this category, there was no significant difference among the others.

Figure III.i.2.13 shows y vs x_1 for process units with at least 6 observations. The addition of interactions with x_1 or x_2 did not improve the fit.

For pumps, the improvement in fit with the addition of process unit terms was not statistically significant.

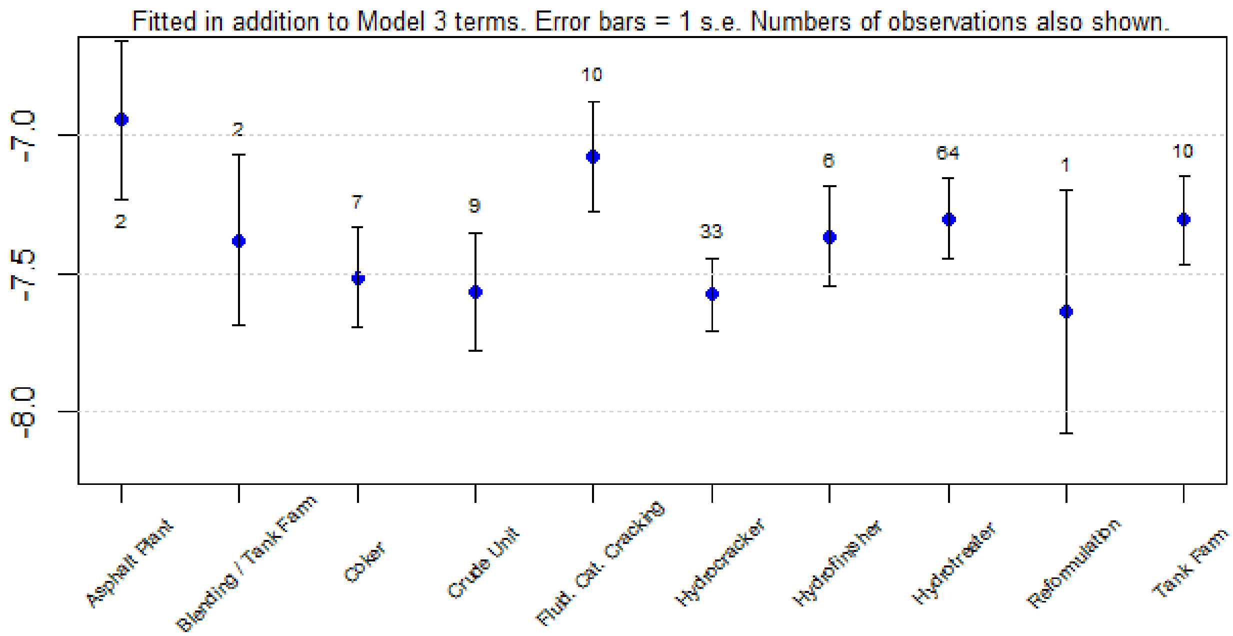

Figure III.i.2.13. Generalized Process Unit / Area Coefficients—Connectors & Valves

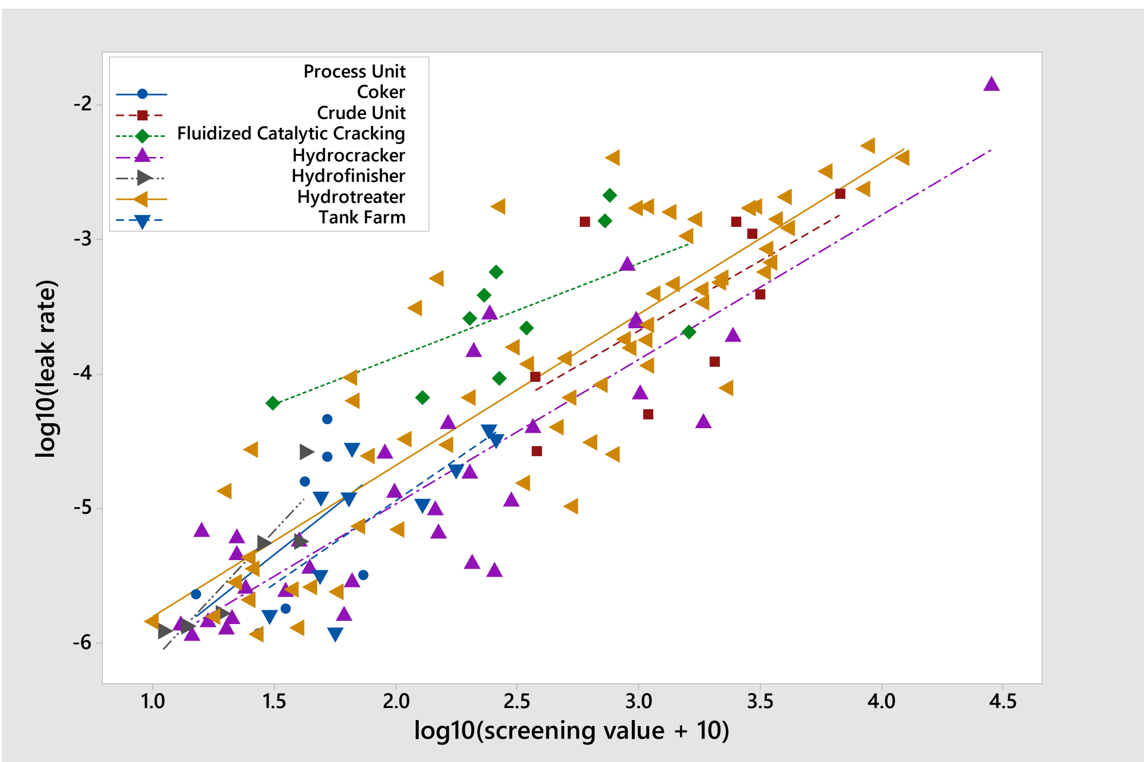

Figure III.i.2.14. Leak Rate vs Screening Value by General Process Unit / Area – Connectors and Valves (for process units with at least six observations)

Because including process unit adds to the complexity of the model while contributing little or nothing to the fit, process unit terms were not included in the final model.

ii. Extrapolation

When applying regression equations to components, caution is warranted to not extrapolate beyond the data used in deriving the regression equations as it can lead to inaccurate results.

Screening Value

The field instruments used to screen components were calibrated with six gases containing different amounts of hydrocarbons (0 ppmv, 10 ppmv, 100 ppmv, 500 ppmv, 3,000 ppmv, and 10,000 ppmv). The process of calibrating an instrument is to introduce a gas with a known amount of hydrocarbon concentration and to program the instrument to provide results that match the calibration gas for a given instrument response (units of current). From this, the instrument develops a relationship between measured values and the calibration gas standards that is used when measuring non-calibration gases.

As with regression analysis, extrapolating results of screening instruments beyond what was used to calibrate the instruments may lead to unreliable estimates.

Because the screening instruments were only calibrated with gases with a maximum hydrocarbon content of 10,000 ppmv, any screening value readings above 10,000 ppmv may not be accurate.

Previous studies have accounted for this by limiting use of regression equations to the highest concentration of gas used to calibrate screening instruments, either 10,000 ppmv or 100,000 ppmv.

Of the bagged data set, two components had *pegged values*, pre-bag screening values above 10,000 ppmv:

- C004: a 10-inch diameter gate valve handling asphalt with a pre-bag screening value of 28,300 ppmv, and
- D027: a 0.5-inch diameter gate valve handling jet fuel with a pre-bag screening value of 12,400 ppmv.

Of the field screening data set, three components had field screening values above 10,000 ppmv all within the same refinery process unit:

- D-499: a 0.75-inch diameter gate valve handling jet fuel with a screening value of 11,385 ppmv,
- D-601: a 2-inch diameter gate valve handling jet fuel with a screening value of 14,789 ppmv, and
- D-810: a 0.5-inch diameter gate valve handling jet fuel with a screening value of 11,985 ppmv.

In the present study, we exclude the components with these pegged values from the estimation and use of correlation equations, estimating these separately, as described below.

Temperature

The temperature range of components that were bagged varied between 48 degrees Fahrenheit to 540 degrees Fahrenheit. During field screening, there were 105 components that had measured temperatures below 48 degrees Fahrenheit and 150 components that had measured temperatures greater than 540 degrees Fahrenheit.

Moderate extrapolation may be acceptable, but too great extrapolation can produce poor estimates. A solution is to cap the temperature variable at 540 (e.g., to replace higher temperatures with 540) when estimating the leak rate.

iii. Regression Scenarios

Repeated (duplicate) measurements were taken at each of the five petroleum refineries. However, the Air District only measured emissions at two of the five petroleum refineries whereas Tricord measured emissions at all five petroleum refineries and comprised the majority (over 90 percent) of the total bagged measurements available for analysis. Although measures were implemented to minimize potential differences between bagging conducted by the Air District and Tricord, there may still be differences in the measurements due to personnel, equipment, and bagging techniques.

As mentioned above, there was also the question of model sensitivity to adding an arbitrary constant to the log screening value (x1). Therefore, restricting data to screening values greater than 10 ppmv was also considered (x1').

To understand these differences, bagged data was analyzed under eight scenarios (Table III.iii-1) depending on:

- the component leak concentration measured right before bagging, (x1 or x1')
- whether the measurement is an initial or duplicate measurement of a component, and
- the party that conducted the bagging.

Table III.iii-1. Different Scenarios for Regression Bag Analyses

Scenario	Description	Screening Values
1	All measurements, including duplicates	$0 \leq$ ppmv $<$ 10,000
2	No duplicate measurements, use first chronological bagged measurement	$0 \leq$ ppmv $<$ 10,000
3	No duplicate measurements, use first Tricord measurement of any duplicates	$0 \leq$ ppmv $<$ 10,000
4	No duplicate measurements, use first Tricord measurement of any duplicates, no Air District measurements	$0 \leq$ ppmv $<$ 10,000
5	All measurements, including duplicates	$10 <$ ppmv $<$ 10,000
6	No duplicate measurements, use first chronological bagged measurement	$10 <$ ppmv $<$ 10,000
7	No duplicate measurements, use first Tricord measurement of any duplicates	$10 <$ ppmv $<$ 10,000
8	No duplicate measurements, use first Tricord measurement of any duplicates, no Air District measurements	$10 <$ ppmv $<$ 10,000

Because the highest concentration of gas used to calibrate the screening instruments was 10,000 ppmv, bag measurements that had pre-bag screening values above 10,000 ppmv may not be accurate and are excluded from all eight scenarios.

The differences between Scenarios 1 through 4 and 5 through 8 is the range of screening values for which to derive and apply regression equations: either to include all bag results with pre-bag screening values below 10,000 ppm or to only include those bag results with pre-bag screening values equal to or greater than 10 ppmv and less than 10,000 ppmv.

For Scenarios 5 through 8, a minimum screening value of 10 ppmv was chosen as it was the concentration of the lowest gas used to calibrate screening instruments. Screening instruments also experienced the greatest instrument drift at the 10 ppmv level as compared to the other five calibration gases leading to greater uncertainty regarding lower screening value measurements.

Other than range of screening values, Scenarios 5 through 8 are identical to Scenarios 1 through 4 where differences include whether to include or exclude duplicate measurements, include or exclude Air District measurements, and which measurement to include of duplicate measurements.

The number of bagged measurements by component type and scenario is provided in Table III.iii-2.

Table III.iii-2. Regression Bagged Sample Sizes by Regression Scenarios

Component Type	Number of Regression Bagged Sample Sizes by Scenario							
	1	2	3	4	5	6	7	8
Pump Seals	31	30	29	28	28	27	26	25
Connectors and Valves	143	131	130	128	129	118	117	115

With the bagged measurements in each scenario, linear regression analysis (ordinary least squares) was performed. Regression coefficients and standard errors as well as the adjusted R^2 and sigma for each scenario are published in Table III.iii-3 for pump seals and in Table III.iii-4 for valves and connectors.

Table III.iii-3. Regression Parameters for Pump Seals by Regression Scenario

Scenario	Regression Coefficients			Regression Standard Errors			Adjusted R^2	Sigma
	Intercept	Screening Value	Temperature	Intercept	Screening Value	Temperature		
1	-8.000	1.426	0.00441	0.403	0.184	0.00139	0.726	0.64
2	-7.978	1.411	0.00443	0.415	0.193	0.00141	0.713	0.65
3	-8.146	1.524	0.00438	0.384	0.182	0.00129	0.769	0.59
4	-8.142	1.519	0.00438	0.392	0.186	0.00131	0.766	0.60
5	-7.729	1.233	0.00620	0.380	0.191	0.00172	0.760	0.61
6	-7.704	1.214	0.00624	0.391	0.201	0.00176	0.750	0.62
7	-7.862	1.332	0.00607	0.354	0.184	0.00157	0.808	0.56
8	-7.860	1.329	0.00607	0.362	0.189	0.00160	0.806	0.57

Table III.iii-4. *Regression Parameters for Valves and Connectors by Regression Scenario*

Scenario	Regression Coefficients			Regression Standard Errors			Adjusted R^2	Sigma
	Intercept	Screening Value	Temperature	Intercept	Screening Value	Temperature		
1	-7.415	1.088	0.00261	0.117	0.044	0.00027	0.842	0.42
2	-7.454	1.116	0.00255	0.120	0.047	0.00029	0.846	0.41
3	-7.472	1.122	0.00263	0.117	0.045	0.00029	0.857	0.40
4	-7.498	1.128	0.00273	0.117	0.046	0.00030	0.861	0.40
5	-7.251	1.029	0.00275	0.132	0.048	0.00029	0.818	0.43
6	-7.274	1.050	0.00269	0.135	0.050	0.00031	0.824	0.42
7	-7.294	1.056	0.00278	0.131	0.048	0.00030	0.838	0.41
8	-7.323	1.064	0.00288	0.130	0.049	0.00032	0.844	0.41

As seen in Table III.iii-3 and Table III.iii-4, the adjusted R^2 for regression equations for pump seals varied between 0.713 to 0.808 and for valves and connectors between 0.818 to 0.861.

For comparison, the regression equations derived in the 1980 EPA Study had a correlation coefficient (r) of 0.78 for valves, 0.68 for pump seals, and 0.74 for flanges[3]. These equate to an R^2 of 0.61 for valves, 0.46 for pump seals, and 0.55 for flanges.

For pump seals, Scenario 7 results in the regression equation with the highest adjusted R^2 and lowest sigma. For valves and connectors, Scenario 4 results in the regression equation with the highest adjusted R^2 and lowest sigma. However, the differences among the scenario fits are indistinguishable statistically.

III.iii.1. Validation Check

Although regressions provide an optimal least-squares fit to the data on the log scale, this does not guarantee such a fit on the original scale. In this section, a comparison is made of the original bagged values, with the raw predictions, and the predictions adjusted for underestimation bias.

For the comparison, the fitted correlation equations were applied to the original bagged values, using pre-bagged screening values and corrected temperatures as predictors. This is a log scale regression prediction for the leak rate of a component. Letting y = $\log_{10}$(leak rate of the component), the model $\hat{y} = b_0 + b_1\, log_{10}(sv) + b_2\, T$, was fitted where sv = screening value + 10 in Scenarios 1-4 and, for Scenarios 5-8, sv=screening value limited to screening values > 10 ppmv; and T is the component temperature during bagging. Pegged values (sv > 10,000 ppmv) were excluded.

The unadjusted leakage rate estimate is $\hat{L}_u = \frac{\sum_{i=1}^{n} 10^{\hat{y}_i}}{n}$, where n is the number of components. The adjusted leakage rate across components is estimated by simulating $\hat{L}_a = \frac{\sum_{i=1}^{n} 10^{\hat{y}_i + e_i^*}}{n}$, where the e_i* are independent normal N(0,sigma) variables and sigma is the regression sigma. These are compared with the mean of actual bagged samples: $L = \frac{\sum_{i=1}^{n} B_i}{n}$.

[3] See Table C6-1 on page C-147 of *Assessment of Atmospheric Emissions from Petroleum Refining: Volume 4. Appendices C, D, and E*. April 1980.

These equations were applied to the n=33 original bagged pumps, and the original n=141 valves and connectors with simulation sizes of 100,000. The figures and tables show the results.

Table III.III.iii.1-1. Comparison of Regression Predicted Emissions to Measured Emissions for Bagged Samples by Scenario

Scenario	Mean Mass of Measurements (kg/hour)					
	Pump Seals			Valves and Connectors		
	Measured	Predicted	Predicted / Measured (%)	Measured	Predicted	Predicted / Measured (%)
1	0.00119	0.00063	53%	0.00039	0.00029	87%
2	0.00123	0.00071	58%	0.00038	0.00028	91%
3	0.00124	0.00085	68%	0.00039	0.00031	87%
4	0.00128	0.00085	66%	0.00040	0.00032	86%
5	0.00132	0.00076	58%	0.00039	0.00029	86%
6	0.00137	0.00085	62%	0.00038	0.00028	91%
7	0.00139	0.00102	73%	0.00039	0.00031	86%
8	0.00144	0.00103	71%	0.00040	0.00032	85%

As shown in Table III.III.iii.1-1, regression equations derived from all eight scenarios underestimated measured emissions by 37 to 47 percent for pump seals and by 9 to 14 percent for valves and connectors. This difference can be attributed to the bias introduced by estimating the mean of the exponentiated value by the exponentiated mean.

Table III.III.iii.1-6 shows comparisons of the adjusted predictions with the actual. For pumps, the ratios cluster around 100%. For valves and connectors, the median ratio is 115%, somewhat above the actual.

Table III.III.iii.1-6. Comparison of Adjusted Regression Predicted Emissions to Measured Emissions for Bagged Samples by Scenario

Scenario	Mean Mass of Measurements (kg/hour)					
	Pump Seals			Valves and Connectors		
	Measured	Predicted	Predicted / Measured (%)	Measured	Predicted	Predicted / Measured (%)
1	0.00119	0.00114	96%	0.00039	0.00045	116%
2	0.00123	0.00113	92%	0.00038	0.00042	109%
3	0.00124	0.00139	111%	0.00039	0.00045	115%
4	0.00128	0.00137	107%	0.00040	0.00046	116%
5	0.00132	0.00126	96%	0.00039	0.00045	116%
6	0.00137	0.00131	95%	0.00038	0.00042	110%
7	0.00139	0.00149	107%	0.00039	0.00046	116%
8	0.00144	0.00154	107%	0.00040	0.00047	117%

III.iii.2. Uncertainties

Although sample sizes were reasonably large, they still represent a single study. Statistical theory shows that the mean prediction from a regression on the log scale will result in a substantial underestimation of the actual mean on the original scale. Adjusting for this expected underestimate may be accomplished through bias correction. However, bias correction will not perfectly match actual results. One question that was investigated was whether discrepancies between the predictions and the actual values was attributable to chance or were they exceptionally large.

To evaluate the uncertainty in the model, the "actual" values was repeatedly simulated, each time fitting the model and making predictions, as follows:

- starting with the regression prediction and sigma from Scenario 1, simulating new "actual" values: $y_i^* = b_0 + b_1 log_{10}(sv_i) + b_2 T_i + e_i^*$, I = 1,…,n, where n = 33 for pumps and n = 141 for valves and connectors and e_i* are simulated independent normal N(0,sigma) variables.
- For each set of "actual" values, the correlation equations were fitted, and unadjusted and adjusted predictions made, yielding simulated actual means

  $L, and\ unadjusted\ and\ adusted\ means\ \ \hat{L}_u^*\ and\ \hat{L}_a^*.$

The figures below show the ratios of predicted to actual: $\frac{\hat{L}_u^*}{L}\, and\, \frac{\hat{L}_a^*}{L}$ for pumps and valves and connectors, based on simulation sizes of 1,000 plus upper and lower 90% confidence limits.

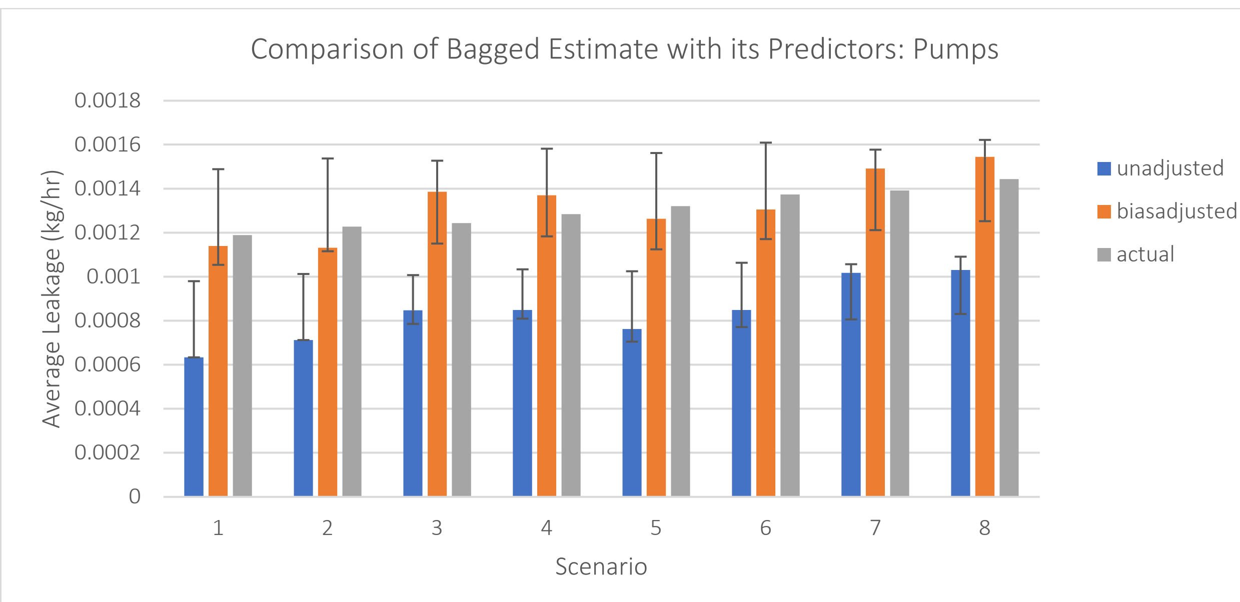

Figure III.III.iii.2-1 Comparison of predicted and adjusted pump means with actual

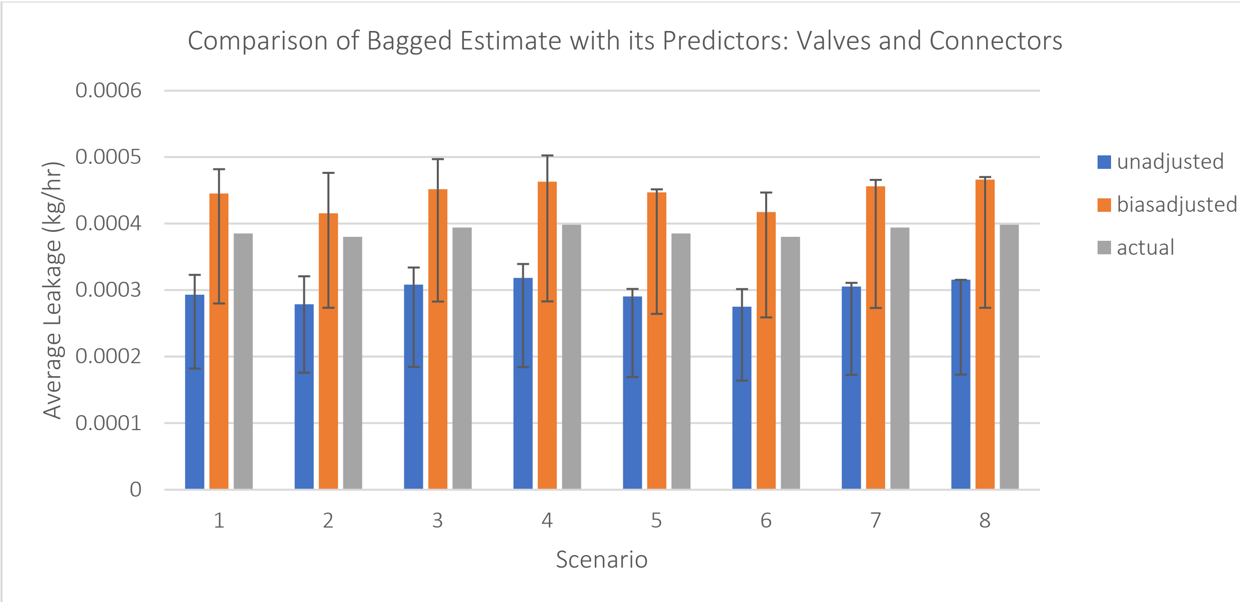

Figure III.III.iii.2-2 Comparison of predicted and adjusted valve and connector means with actual

For the unadjusted predictions, the confidence intervals fall below the actual, as expected. But the confidence intervals for the bias adjusted cover the actual, and the attributable ratios above – 92% to 107% for pumps and 110% to 117% for connectors and valves – fall within the confidence limits. Thus, there is no statistical evidence for model lack of fit.

IV. Uncertainty Methodology

i. Background

Surveys like the current Study include some degree of uncertainty. There is measurement error and there can be sampling error unless a complete census is taken. As can be seen above, component leakages have an extremely skewed distribution, with the vast majority being negligible, a minority with significant leakage, and one or two with very large leakage. Because estimation of the total or mean leakage is required, these very large leakers must be considered; the presence or absence of one or two such can affect the result substantially. It is possible to estimate the uncertainty, to provide a range of likely total or mean estimates.

In the model, the error term, e_i*, can be thought as representing measurement error, not just in the calibration of the other variables to the bagged leakage rate, but the error in the bagged leakage rate measurement as well.

Component leakage varies over time, but the observations are snapshots, taken at a specific time, rather than measured the entire year. Thus, even for a sampled component, the associated measurement is a sample of size one from its annual leakage distribution. And if the screened values themselves are a sample and not a census, then the estimate of uncertainty in the final estimate of the common mean, μ, must also take this sampling uncertainty into account also.

Contrast with the 1980 EPA Study

This study follows the methodology of the 1980 EPA study to a large extent, but there are some key differences necessitated because the sampling design was different.

The 1980 EPA Study did not determine a regression equation that perfectly modeled a relationship between independent variables (e.g., leak concentration) and measured mass emissions. Therefore, the 1980 EPA Study accounted for the regression error term in several ways including directly adjusting the measured values from one refinery that was determined to have a systematic bias as well as a scale correction bias.

In both the Heavy Liquids Study and the 1980 EPA Study, some refinery components were bagged, and a larger sample screened.

In both studies, a regression analysis was used to predict the bagged values from other variables, the goal being to make emissions rate estimates for the components that were screened but not bagged. In both studies, the relationship between bagged values and screening values differed by component type, so that more than one regression equation was used.

In the 1980 EPA Study, as with the current study, the regression analysis was done on the log scale because the distribution of leak rates was highly skewed. Because the mean emission rate was developed from the sum of emissions on the original scale and because simply averaging the exponentiated regression predictions would result in a downwardly biased estimate[4], random errors were simulated and added to the predicted values before exponentiation[4]. Thus, either directly bagged or indirectly estimated leakage rates were available for all sampled components.

However, because the design of the 1980 EPA Study and the Heavy Liquids Study differed, how the leakage rates will be estimated may differ and require different methods.

The following table provides a comparison of the number of components that were screened and bagged in the 1980 EPA Study and the current Study.

Table IV.i-1. Comparison of Number of Components Bagged and Estimated in 1980 EPA Study and Current Study

Type	Sources Sampled		Sources to Be Estimated (2)		Percentage of Components Sampled	
	1980 Study (1)	Study	1980 Study (1)	Study	1980 Study (1)	Study
Valves	474	70	153	5,350	75.6	1.3
Pump Seals	281	32	101	734	73.6	4.4
Flanges	43	N/A	19	N/A	69.4	N/A
Connectors	N/A	61	N/A	4,710	N/A	1.3

Notes:
1. Source: Unnumbered table on page C-146 in Appendix C of *Assessment of Atmospheric Emissions from Petroleum Refining: Volume 4. Appendices C, D, and E*. April 1980.
2. Sources to be estimated represent the number of components whose emissions will be estimated by regression equations. Unlike the current Study, the 1980 EPA Study did not use regression equations to estimate emissions of bagged components.

In the 1980 EPA Study, a large fraction of the screened values was bagged. The overall sample sizes were in the hundreds.

In the present study, most screened components were not bagged, but the number of screened components in heavy liquid service was much larger (approximately 10,000). Another important difference was that component selection and sampling was done randomly in the 1980 EPA Study but not in the current study.

In the 1980 EPA Study, a key factor was the relatively small sample sizes. The analysis was done separately for different component types and based on whether the stream was in gas, light liquid, or heavy liquid service. The highly skewed leak rates resulted in the simple arithmetic mean not being efficient – a few large outliers typically dominated, making the result uncertain. Fortunately, the distribution of the log leak rates was determined to be approximately Gaussian. For this, statistical theory produces a much more efficient estimator based on the sample mean and variance on the log scale, and a scaling factor which provided a bias adjustment to the naive estimator[5].

[4] For the 1980 study, see the leak rate equation and discussion on page C-146 in Appendix C of *Assessment of Atmospheric Emissions from Petroleum Refining: Volume 4. Appendices C, D, and E*. April 1980.
[5] See Section 5.1.2.2, page 110, from the Assessment of Atmospheric Emissions from Petroleum Refining: Volume I, Technical Report, EPA-600 /2-80-075a, April 1980, and page C-151. The adjustment is from J.D. Finney, "On the Distribution of a Variate Whose Logarithm is Normally Distributed," *Journal of the Royal Statistical Society, Series B*, 7:155-161, 1941.

In the present study, the sample size is much larger, but the observations were not taken randomly. Almost all pumps[6] were screened, that is, a virtual census. Therefore, there is essentially no sampling error, the only error deriving from estimation of the leakage rates from measurements, and that they were made over a short period.

Estimates of total emissions from connectors and valves are more involved. One issue is that the sampling was not done at random. Instead, only a few process units and stream services were sampled for each refinery. Because of this it is important to investigate the extent that leakage rates might vary among the units or services and, if substantial variation were found, to estimate the leakage rate for each unit or service and then take a weighted average where the weights were the fraction the unit or service had of the total number of components in the five refineries. Although steps were taken to minimize component selection bias, there is also the problem that sampling was not random even within a process unit or service. This is a potential source of error that may not be estimated.

To determine whether the same approach for errors used in the 1980 EPA Study may be applied in the current Study, the distribution of leak rates on the transformed scale (logarithmic) was evaluated. If the distribution follows a Gaussian (normal) distribution, then the same approach could be used. The distribution may be viewed though a histogram as well as a quantile-quantile (Q-Q) plot. A Q-Q plot charts the quantiles (equal-sized partitions) of two probability distributions against each other for comparison purposes.

Using regression equations developed from the field screening data set, the resulting mass emissions may be plotted within histograms and Q-Q plots to see if the same approach as the 1980 EPA Study may be used.

The following figures demonstrate that the aggregate distributions of connectors and valves, and of pumps, are not Gaussian on the log scale. The histograms (Figure IV.i.1a and Figure IV.i.2a) show that both are right-skewed rather than bell-shaped. Figure IV.i.1b and Figure IV.i.2b show a plot of the log (leak rate) quantiles compared with theoretical Gaussian quantiles. If the log (leak rate) were normally distributed, these plots would be almost straight. Instead, they are concave, an indication of being right-skewed relative to the Gaussian distribution.

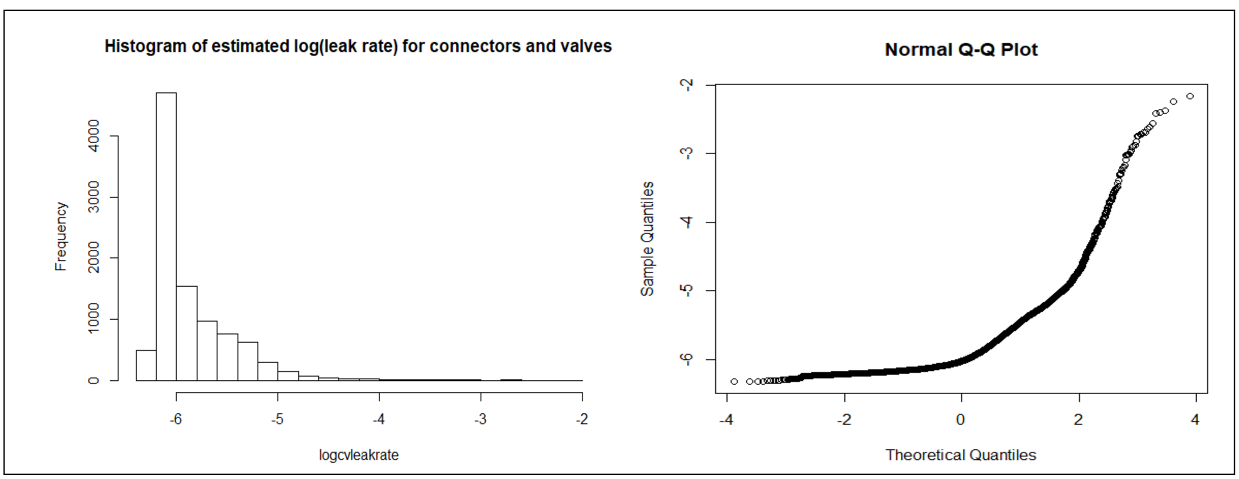

Figure IV.i.1.. a) Histogram of log leak rate for connectors and valves, b) Normal Q-Q plot of log leak rate for connectors and valves

[6] Some pumps were not screened because they were not accessible or were not operation.

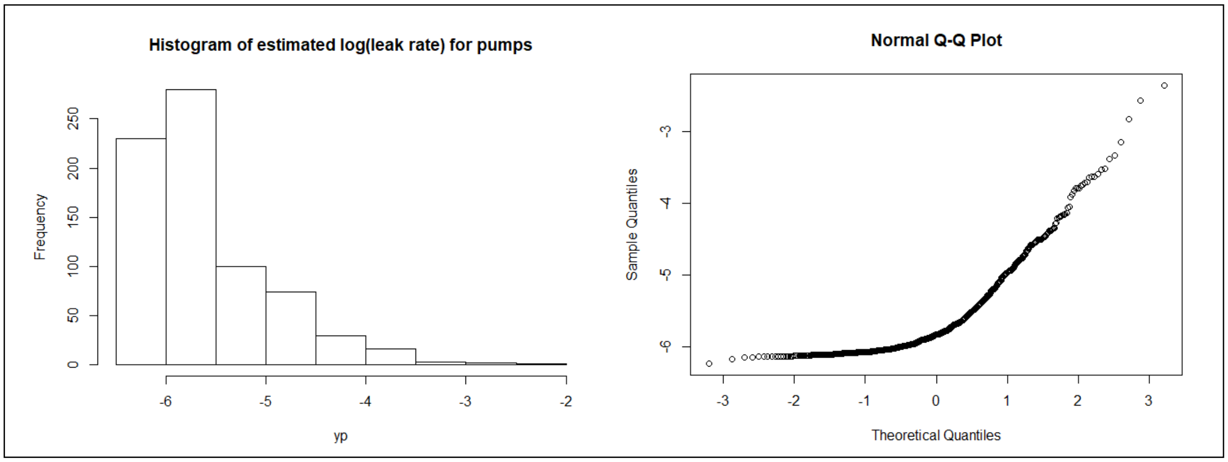

Figure IV.i.2. a) Histogram of log-leak rate for pumps, b) Normal Q-Q plot of log leak rate for pumps

Thus, the more efficient estimator used in the 1980 EPA Study is not appropriate here.

ii. Approach

A basic statistical theorem, the Law of Large Numbers, states that if there is a set of independent random variables, Y_1, Y_2, …, with common mean μ, then the sample mean based on n observations, $\bar{Y} = (Y_1 + Y_2 + \ldots + Y_n)/n = S/n$, gets closer and closer to μ as n becomes very large.

If all the components in the petroleum refineries could have been bagged at randomly selected times (a census), then S (or $n\bar{Y}$) would be a quite reasonable estimator of the total[7]. But if only a small number of components are measured, then the sample mean may differ substantially from the petroleum refinery-wide mean.

If the parametric distribution of the Y_i happens to be known, then another function of the Y_i may yield a more "efficient" estimator of μ, one that tends to be closer, that is, making more efficient use of the data.

This was done in the 1980 EPA Study, which assumed that the logarithm of leakage rates was normally distributed. In this Study, that assumption is false as shown in Figure IV.i.1 and Figure IV.i.2 above.

If the screened values themselves are a sample and not a census, then the estimate of uncertainty in the final estimate of the common mean, μ, must also take the sampling error into account.

Within this Study, because the sample sizes are large, the sample means of the estimated leak rates are simply computed. Because the sample sizes are large, the sampling uncertainty of the estimate is not too great. However, owing to the practical difficulty of sampling several hundred thousand components, a census of connectors and valves was not accomplished.

[7] Not perfect since measured emissions were a snapshot for each component as the goal is measuring the emissions over the entire year, plus the error in the measurement of mass.

Bootstrap Sampling

To account for sampling error, one may use a re-sampling technique such as bootstrapping with replacement. In bootstrapping with replacement, a new sample data set of the same size as the original data set is created. For each place within the new data set, an observation from the original data set is randomly selected and placed within the new data set. From the newly created data set, the mean is determined. This process is repeated multiple times to create a set of means.   The idea of the bootstrap is to approximate an actual distribution with the sample distribution. Here, the intent is that the distribution of the set of means mimics the actual distribution.

The following figure illustrates the bootstrap with replacement process for five re-samples and using a software program to randomly create the bootstrap samples.

Example:

Sample	Observations in Array Form	Sample Mean
Original Sample	[1, 5, 6, 3, 2]	3.4
Bootstrap Sample 1	[3, 1, 1, 1,5]	2.2
Bootstrap Sample 2	[6, 2, 2, 6, 5]	4.2
Bootstrap Sample 3	[3, 6, 6, 5, 2]	4.4
Bootstrap Sample 4	[1, 1, 3, 1, 2]	1.6
Bootstrap Sample 5	[5, 5, 3, 2, 5]	4.0

Mean of Bootstrap Samples: 3.3

Figure IV.ii.1. *Example of Bootstrapping with Replacement*

In this example, the original sample had a mean of 3.4 while the mean of the five bootstrap samples is 3.3[8].   The variation in the bootstrapped sample means provides an estimate of the true distribution of errors, that is, it provides a reasonable estimate of uncertainty. From a large bootstrap sample, the upper and lower percentiles can be chosen to provide a confidence interval for the mean.

One additional complication arises when regression is done on one scale, but what is of interest is the mean on the original scale – the mean leak rate. When regression is accomplished on one scale (e.g., logarithm) by transforming data and then the resulting regression-derived values are de-transformed, an additional error is introduced termed transformation scale bias. Averaging the exponentiated regression predictions would result in a downwardly biased estimate[9]. The 1980 EPA Study corrected for this bias through use of a Scale Bias Correction Factor.

The present study takes advantage of the much larger set of components that were screened but not bagged. With a regression of bagged values on screening and other variables, the analysis is calibrating these variables to be measurements of the bagged values.

As discussed above, for non-exact regression equations (e.g., $y = b_0 + b_1x_1 + b_2x_2 + e$, where y is the log of the bagged leak rate) there are two terms: the predicted value (e.g., $b_0 + b_1x_1 + b_2x_2$) and an error term (e).

[8] The bootstrap mean converges to the sample mean as the number of bootstrap samples grows large.
[9] This is a consequence of Jensen's Inequality.

The first term can be thought of as the calibrated measurement. The error term can be thought of as representing measurement error, not just in the calibration of the other variables to the bagged leakage rate, but the error in the bagged leakage rate as well.

The distribution of y = log (leak rate) has been demonstrated to not be normal and thus the same approach used in the 1980 EPA Study, where the non-zero leakage rates were assumed to be lognormally distributed, is not appropriate. However, the regression errors are reasonably approximated by the normal distribution.

An understanding of the distribution of the error term, e, can be made from the regression residuals. Figure IV.ii.2 shows the residuals[10] from a regression model for connectors and valves and another one for pumps each developed under one of the scenarios in Table III.iii-1.

A 1:1 line is drawn in shows the high degree of linearity. In both cases the correlation of the residuals with normal quantiles is 0.99. These correlations were used as a test for normality by vectors of normal variates of the same size, computing correlations with the normal quantiles, and seeing where the correlations with residuals fall. Based on simulations of 10,000, the estimated p-values were 0.11 and 0.55 respectively, so the assumption of normality could not be rejected.

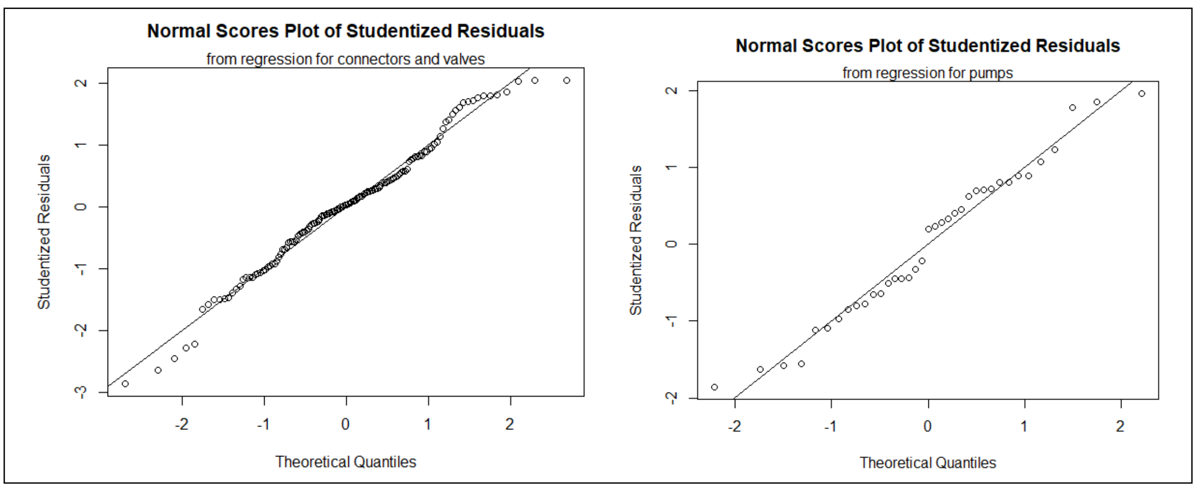

Figure IV.ii.2. Normal Q-Q plots of residuals versus quantiles of the normal distribution

Simulation

A straightforward alternative is simulation. The goal is to estimate the expected value of the exponentiated variable, L = e^Z :$E(L) = \int_{-\infty}^{\infty} e^z f(z)dz$, where f(z) is the probability density function of Z. If f(z) were known, by simulating random variates Z_1, Z_2, … Z_n, from f(z), and computing $\frac{\sum_{i=1}^{n} e^{z_i}}{n}$, we could get arbitrarily close to this integral by the Law of Large Numbers.

[10] These residuals have been studentized to have mean 0 and constant variance 1.

If every component screened had been bagged, yielding measured leakage rates L_i, i=1,…,n, then $\bar{L} = (L_1 + L_2 + \ldots + L_n)/n$, would be an unbiased estimate of the mean leakage rate, and a reasonable one, given the large samples, because of the Law of Large Numbers.

Here $Y_i = \log_{10}(L_i) = b_0 + b_1 x_{1i} + b_2 x_{2i} + e_i$ is modeled. Y_i is not observed for most components, but can be predicted by $b_0 + b_1 x_{1i} + b_2 x_{2i}$, with the knowledge that the error terms are roughly Gaussian. By simulating the e_i, as e_i^*, using the regression sigmas, the distribution of the Y_i can be approximately simulated as $Y_i^* = b_0 + b_1 x_{1i} + b_2 x_{2i} + e_i^*$.

As the Gaussian assumption is not unreasonable for the regression errors, the errors can be simulated using pseudo-random normal variates and added to the regression predictions. $\bar{L}$ can then be estimated by $\frac{\sum_{i=1}^{n} e^{Y_i^*}}{n}$.

V. Mean Emissions Estimate Methodology

As discussed previously, emissions from Study components are estimated from two terms: the predicted term and error term.

i. Predicted Term

How the predicted term is estimated depends upon which set of regression equations are used and the specifics of the component.

For example, in Scenarios 1 through 4 of Table III.iii-1, regression equations were derived with and were used for components that had a net screening value greater than 0 ppmv and below 10,000 ppmv. The prediction for the ith component was:

$$\hat{y}_i = b_0 + b_1 x_{1i} + b_2 x_{2i} \qquad \text{[Equation D-1]}$$

where b_0, b_1 and b_2 are coefficients from a row of table Table III.iii-3 for a pump seal and in Table III.iii-4 for a valve or a connector, x_{1i} = $\log_{10}$(screening value of ith component + 10) and x_{2i} = operating temperature of ith component.

In Scenarios 5 through 8 of Table III.iii-1, regression equations were derived with and used for components that had a net screening value equal to or greater than 10 ppmv and below 10,000 ppmv. The prediction for the ith component was:

$$\hat{y}_i = b_0 + b_1 x'_{1i} + b_2 x_{2i} \qquad \text{[Equation D-2]}$$

where b_0, b_1 and b_2 are coefficients from a row of table Table III.iii-3 for a pump seal and in Table III.iii-4 for a valve or a connector, x_{1i}' = $\log_{10}$(screening value of ith component) and x_{2i} = operating temperature of ith component.

For components that had a net screening value less than 10 ppmv, emissions were estimated by randomly selecting one of the bagged components that had a net screening value below 10 ppmv and substituting the mass emissions from the selected component for the emissions of the Study component. No statistical difference was found among the bagged values of connectors, valves and pumps with net screening values below 10 ppmv, so sampling was done from the pooled sample.

ii. Error Term

The error terms were assumed to be Gaussian. For each component, i, a pseudo-random standard normal variate was generated and multiplied by the regression standard error and added to the regression mean using the following equation:

$$e_i = s \; z_i \qquad \text{[Equation D-3]}$$

where:

e_i* = pseudo-random normal observation for the i[th] component

s = regression standard error

z_i = pseudo-random standard normal variate

iii. Emissions Estimation

This study estimated mean emissions by simulating the emissions from individual screened components and averaging them. The resulting simulated means provide both an estimate of mean emissions as well as an estimate of the uncertainty. The following section lays out the simulation methodology.

V.iii.1. Simulated Emissions

The simulation method depends on whether the screening sample can be considered a census, as with pumps, or as a fraction of the total population of components, as with connectors and valves.

V.iii.2. Simulations for a Census of Components – Method for Pump Seals

If using regression equations derived from Scenario 1 through 4, emissions of the i[th] pump is simulated using the following equation:

$$L_i^* = \begin{cases} 10^{\hat{y}_i + e_i^*}, & \text{if screening value}_i < 10{,}000 \text{ ppmv} \\ P_i^* & \text{if screening value}_i \geq 10{,}000 \text{ ppmv} \end{cases}$$ [Equation D-4]

i = 1,…, n, where n = number of pumps

where:

L_i* = pseudo-random observation for the i[th] component

$\hat{y}_i$ = predicted value from the regression equation for the i[th] component, using equation D1.

e_i* = pseudo-random normal observation for the i[th] component

P_i^* = randomly selected bagged value where screening value was ≥ 10,0000 ppmv

If using regression equations derived from Scenario 5 through 8, emissions are simulated using the following equations:

$$L_i^* = \begin{cases} B_i^*, & \text{if screening value}_i \leq 10 \text{ ppmv} \\ 10^{\hat{y}_i + e_i^*}, & \text{if screening value}_i > 10 \text{ ppmv and} < 10{,}000 \text{ ppmv} \\ P_i^*, & \text{if screening value}_i \geq 10{,}000 \text{ ppmv} \end{cases}$$ [Equation D-5]

i = 1,…, n, where n = number of pumps

where:

$\hat{y}_i$ = predicted value from the regression equation for component I (where screening value > 10 ppmv)

e_i* = pseudo-random normal observation

B_i^* = randomly selected bagged value from bagged measurements with screening values ≤ 10 ppmv

P_i^* = randomly selected bagged value where screening value was ≥ 10,0000 ppmv

V.iii.3. Simulations That Include Sampling Error – Method for Connectors and Valves

The regression error term addresses the difference between regression prediction and the observed values used to derive the regression equations.

However, there is an additional error when the observations are a sample and not the population.

For pumps, for which there was essentially a census, there is virtually no sampling error.

For connectors and valves, as the sample size was much smaller than the population, sampling error was considered. In this case, bootstrap sampling of the screened values was employed to account for sampling error. To simulate this case, a bootstrap sample of (SV_{1i}*, T_{2i}*) pairs was selected from the set of screened connector and valve observations, i = 1, ..., n = # of screened connectors and valves. As with the simulation of pumps, different equations were used for scenarios 1-4 and scenarios 5-8. For scenarios 1-4, the predictions were

$\hat{y}_i^* = b_0 + b_1 x_{1i}^* + b_2 x_{2i}^*$, and $\hat{y}_i^* = b_0 + b_1 x_{1i}'^* + b_2 x_{2i}^*$ for connectors and valves,

where the x_1 and x_2 are defined with Equations D-1 and D-2. Then Equations D-4 or D-5 were applied to simulate connector or valve emissions L_i*.

iv. Approach by Component Type and Regression Derived Equations

V.iv.1. Pump Seals, Scenarios 1 - 4 – Regression Equations Using Entire Range of Screening Values

Step 1: Use regression-derived equations to estimate predicted emissions from the entire field screening data set For regression equation terms of logarithmic form, add a constant, i = 1 to n, where n = # of screened pumps.

$\hat{y}_i = b_0 + b_1$*log10[screening value$_i$ + 10] + b_2*temperature$_i$

Step 2: Generate an array – of the same size as the number of pump observations) - of pseudo-random normal observations, e_i*, (mean 0, standard deviation = regression standard deviation).

Step 3: Add the random variates to the predicted values (the same set of random variates will be used in all scenarios to make comparisons between them more precise): $\hat{y}_i + e_i^*$

Step 4a: If screening value$_i$ < 10,000 ppmv, estimate the leak rate of the ith pump as $L_i^* = 10^{\hat{y}_i + e_i^*}$,

Step 4b: If screening value$_i$ ≥ 10,000 ppmv, estimate the leak rate of the ith pump as $L_i^* = P_i^*$, where P_i* is randomly selected from the set of bagged values, P_i, whose pre-bagged screening value was ≥ 10,000 ppmv.

Step 5: Estimate the mean leak rate for pumps as: $\bar{L}_P = \frac{\sum_{i=1}^{n} L_i^*}{n}$.

Step 6: Repeat Steps 2 to 5 10,000 times to derive an array of 10,000 means

Step 7: From the 10,000 means, construct the median and a 90 percent confidence interval.

A diagram of this approach is shown in the following figure.

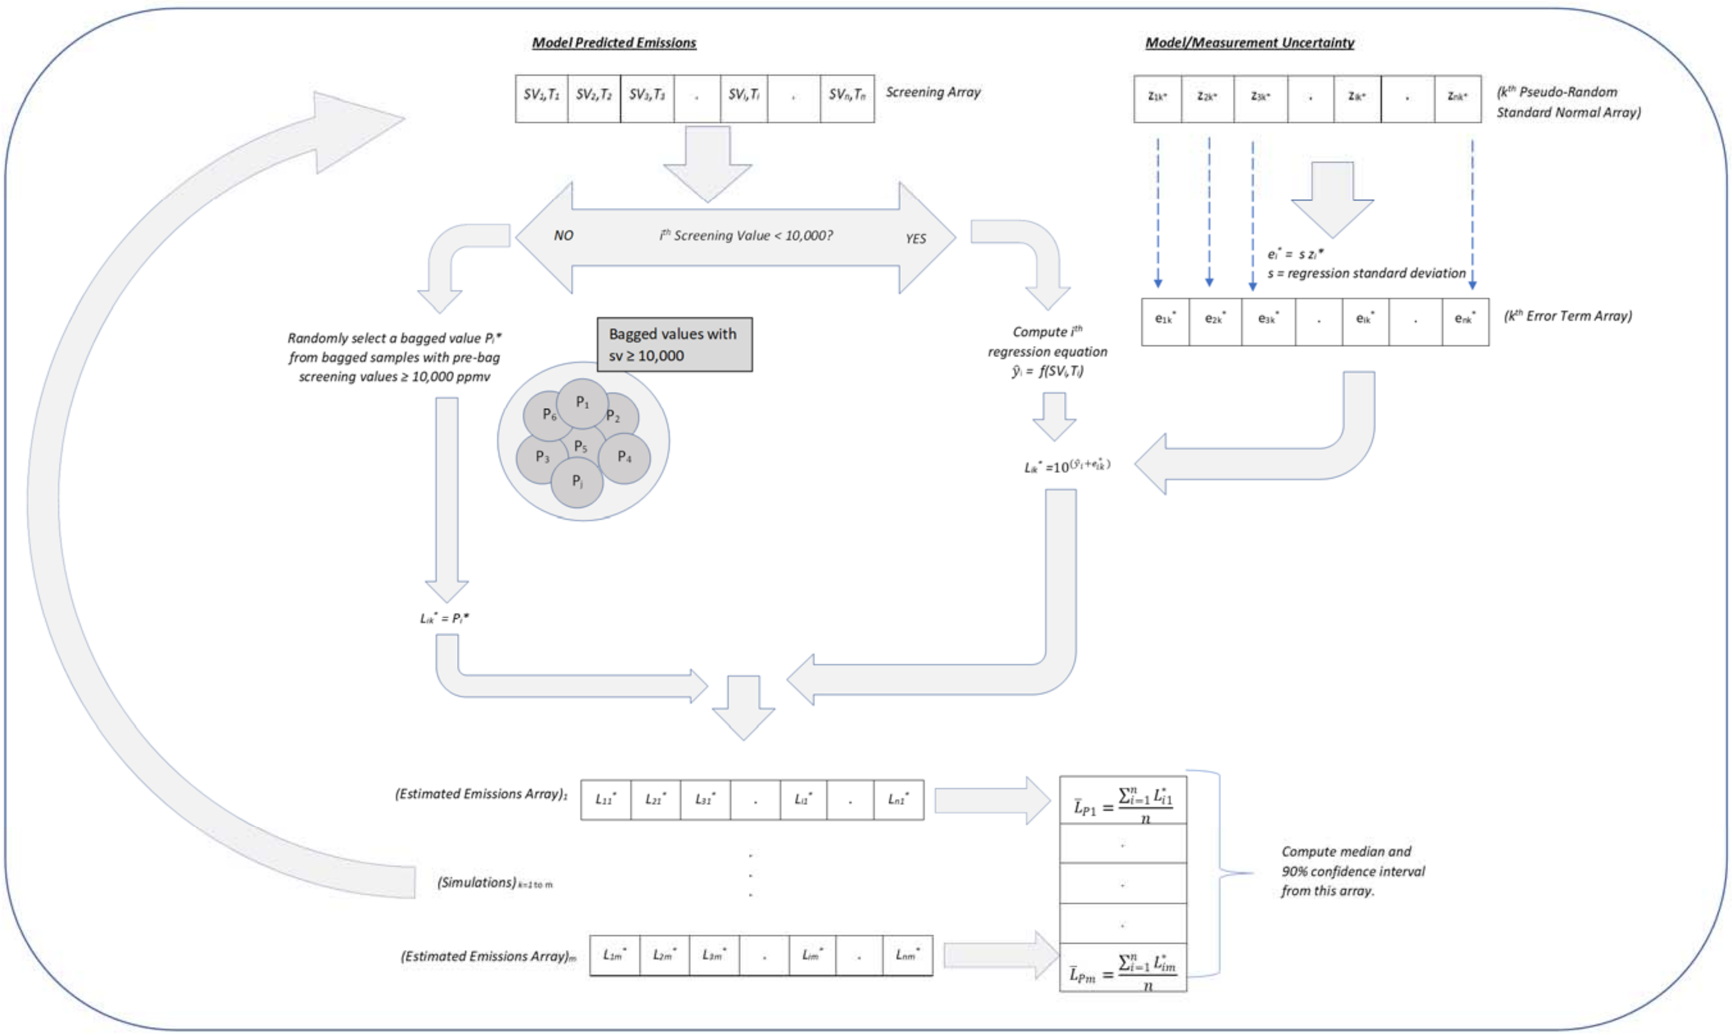

Figure V.iv.1.1. Emissions Estimation Approach for Pump Seals, Scenarios 1-4

V.iv.2. Connectors and Valves, Scenarios 1 - 4 – Regression Equations Using Entire Range of Screening Values

Step 1: Use regression-derived equations to estimate predicted emissions from the entire field screening data set Use the regression terms, a, b & c, to compute estimates of component leakage rates, i = 1 to n, for the n screened connectors (Identical methodology used for valves).

$\hat{y}_i = b_0 + b_1$*log10[screening value$_i$ + 10] + b_2*temperature

Step 2: Generate an array – of the same size, n, as the number of connector observations) – of pseudo-random normal observations, e_i*, (mean 0, standard deviation = regression standard deviation)

Step 3: Add the random variates to the predicted values (the same set of random variates will be used in all scenarios to make comparisons between them more precise): $\hat{y}_i + e_i^*$

Step 4: Draw bootstrap sample of size n the array of predicted values: $\hat{y}_i^* + e_i^*$

Step 5a: If screening value$_i$ < 10,000 ppmv, estimate the leak rate of the ith connector or valve as $L_i^* = 10^{\hat{y}_i^* + e_i^*}$,

Step 5b: If screening value$_i$ ≥ 10,000 ppmv, estimate the leak rate of the ith connector as $L_i^* = P_i^*$, where P_i* is randomly selected from the set of bagged values, P_i, whose pre-bagged screening value was ≥ 10,000 ppmv.

Step 6: Estimate the mean leak ($\bar{L}_C$)using the following equation $\bar{L}_C = \frac{\sum_{i=1}^{n} L_i^*}{n}$Step 6: Repeat Steps 2 to 5 10,000 times to derive an array of 10,000 means

Step 7: From the 10,000 means, construct the median and a 90 percent confidence interval.

A diagram of this approach is shown in the following figure.

Valves, Scenarios 1-4. Use identical methodology as for connectors to derive $\bar{L}_V$.

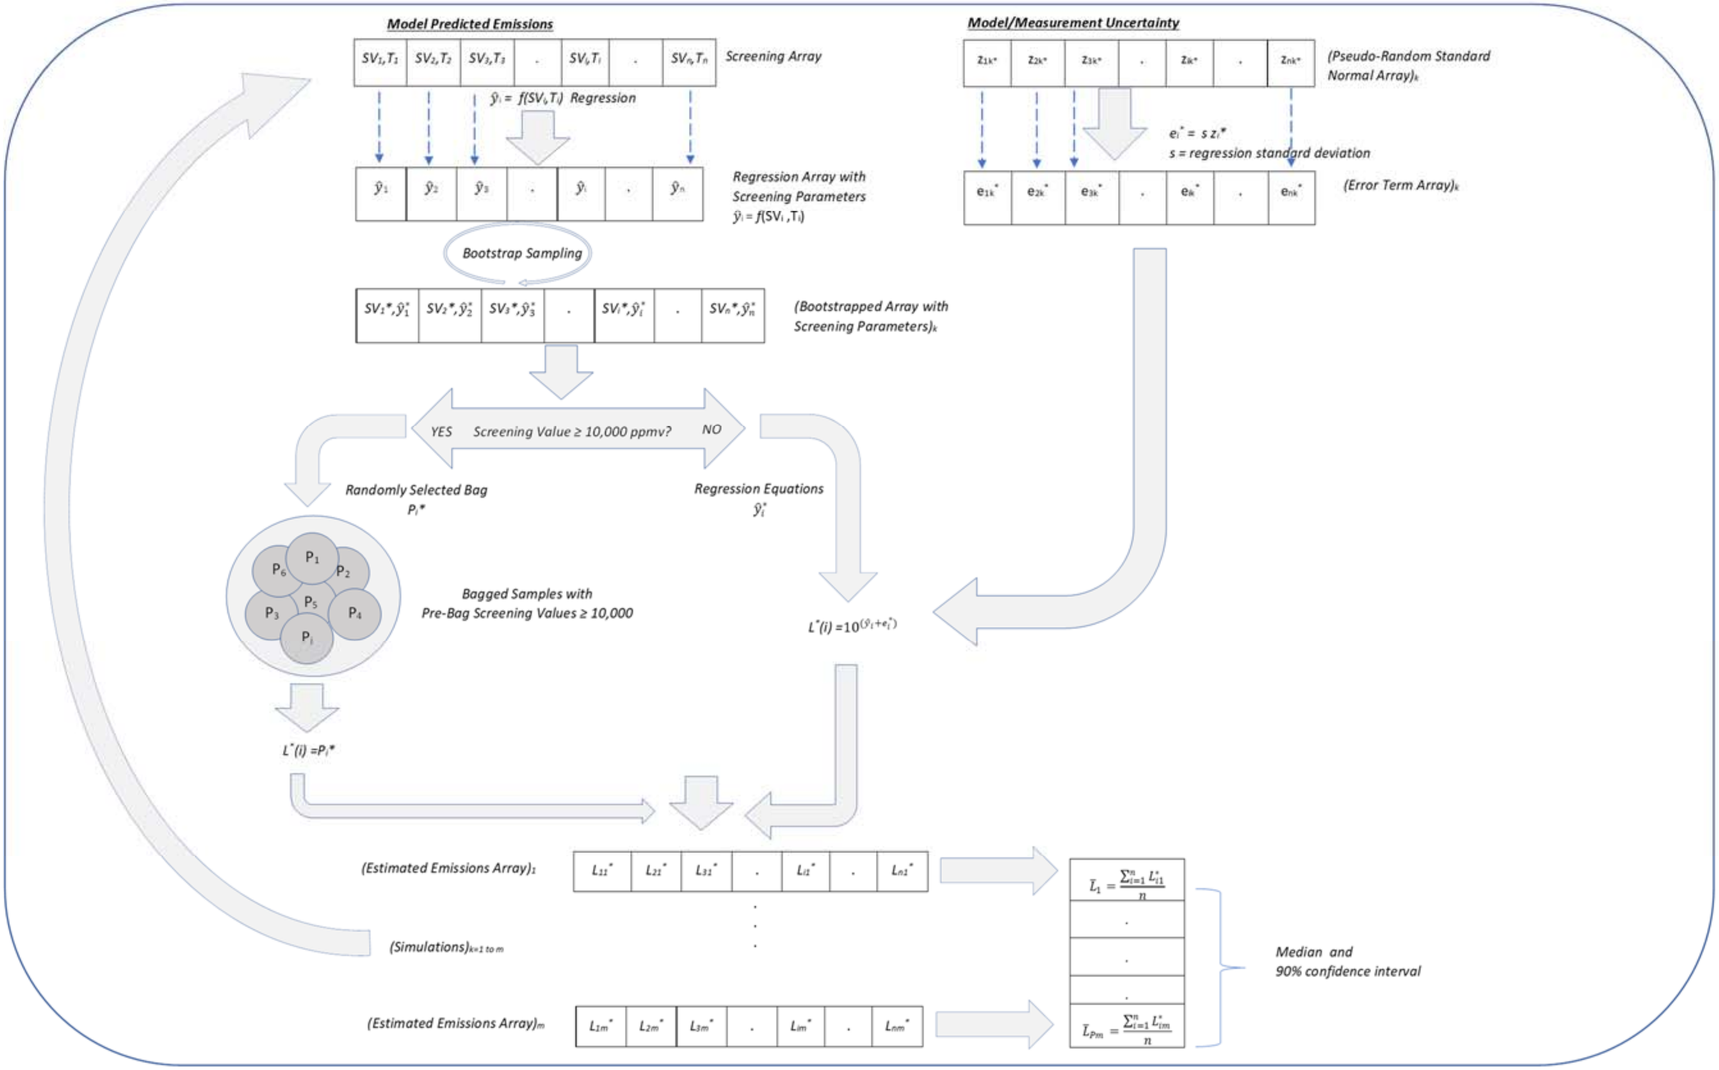

Figure V.iv.2.1. Emissions Estimation Approach for Connectors and Valves, Scenarios 1-4.

V.iv.3. Pump Seals, Scenarios 5 - 8 – Regression Equations Using Limited Range of Screening Values

Step 1: Predict emissions for each field screening observation

For each observation, predicted emissions will depend on the field screening leak concentration: If the field screening leak concentration is less than 10 ppmv, one of the bagged samples that had pre-bag screening values less than or equal to 10 ppmv, will be randomly selected and its measured mass will be used for the predicted emissions. If the screening value is greater than 10,000 ppmv, use one of the bagged samples that had pre-bag screening values greater than 10,000 ppmv.

If the field screening leak concentration is between 10 ppmv and 10,000 ppmv, use the regression-derived equations to estimate predicted emissions

Step 2: Generate an array – of the same size as the number of pump observations > 10 ppm and < 10,000 ppmv - of pseudo-random normal observations, e_i*, (mean 0, standard deviation=regression standard deviation).

Step 3: Add the random variates to the predicted values (the same set of random variates will be used in all scenarios) to those components where the pre-bag screening value was > 10 and < 10,000: $\hat{y}_i + e_i^*$

Step 4: Estimate the mean leak ($\bar{L}_P = \frac{\sum_{i=1}^{n} L_i^*}{n}$) using the following equation:

$$
\mathrm{L}_\mathrm{i}^* = \begin{cases} \mathrm{B}_\mathrm{i}^*, & \text{if screening value}_\mathrm{i} \leq 10 \text{ ppmv} \\ 10^{\hat{y}_\mathrm{i}+\mathrm{e}_\mathrm{i}^*}, & \text{if screening value}_\mathrm{i} > 10 \text{ ppmv and} < 10{,}000 \text{ ppmv} \\ \mathrm{P}_i^*, & \text{if screening value}_\mathrm{i} \geq 10{,}000 \text{ ppmv} \end{cases}
$$

i = 1,…, n, where n = number of pumps with 10 < sv < 10,000 and where:

$\hat{y}_i$	= predicted value from the regression equation for component I (where screening value > 10 ppmv)
e_i*	= pseudo-random normal observation
B_i^*	= randomly selected bagged value where its screening value was ≤ 10 ppmv
P_i^*	= randomly selected bagged value where its screening value was ≥ 10,0000 ppmv

Step 4: Repeat steps 1 through 4 10,000 times to derive an array of 10,000 means

Step 5: From the 10,000 means, construct the median and a 90 percent confidence interval.

A diagram of this approach is shown in the following figure.

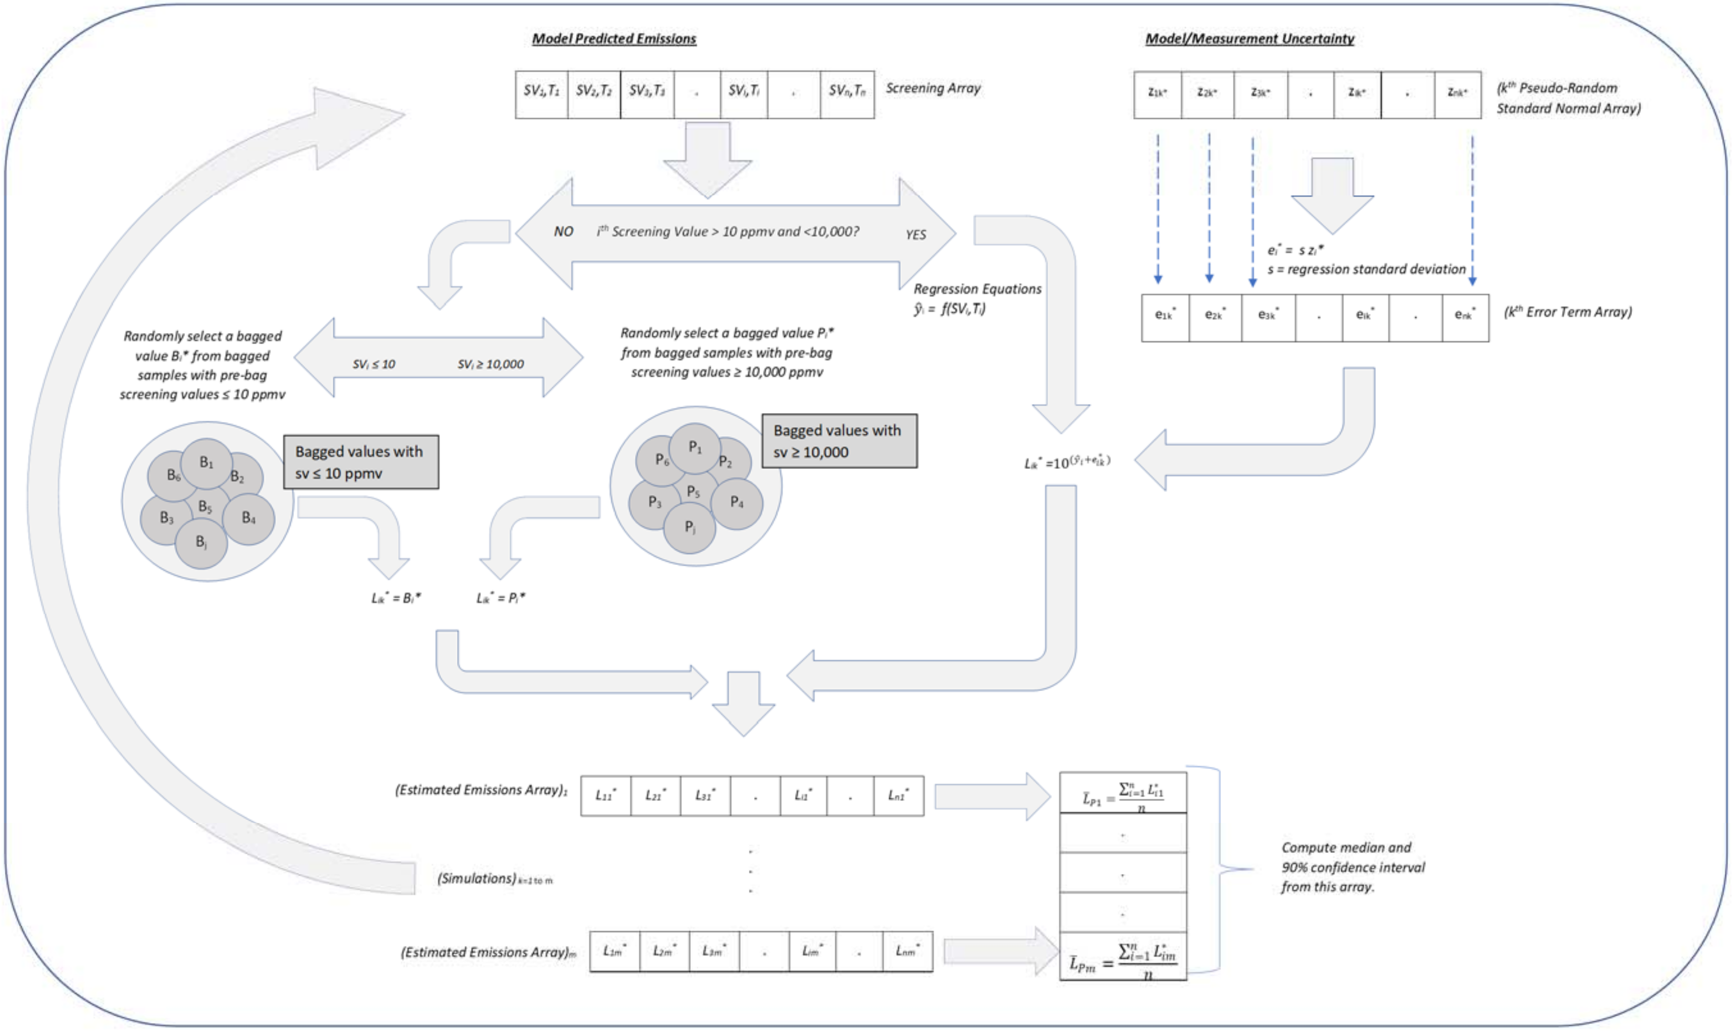

Figure V.iv.3.4. Emissions Estimation Approach for Pump Seals, Scenarios 5-8

V.iv.4. Connectors and Valves, Scenarios 5 - 8 – Regression Equations Using Limited Range of Screening Values

Step 1: Predict emissions for each connector field screening observation

For each observation, predicted emissions will depend on the field screening leak concentration: If the field screening leak concentration is less than 10 ppmv, one of the bagged samples that had pre-bag screening values less than or equal to 10 ppmv, B_i will be randomly selected and its measured mass will be used for the predicted emissions. If the screening value is greater than 10,000 ppmv, randomly select one of the bagged samples, P_i, that had pre-bag screening values greater than 10,000 ppmv.

If the field screening leak concentration is between 10 ppmv and 10,000 ppmv, use the regression-derived equations to estimate predicted emissions

Step 2: Generate an array – of the same size as the number of pump observations > 10 ppmv and < 10,000 ppmv - of pseudo-random normal observations, e_i*, (mean 0, standard deviation=regression standard deviation).

Step 3: Add the random variates to the predicted values (the same set of random variates will be used in all scenarios) to those components where the pre-bag screening value was > 10 and < 10,000: $\hat{y}_i + e_i^*$

Step 4: Draw bootstrap sample of size n from the array of predicted values

Step 5: Estimate the mean leak ($\bar{L}_P$) using the following equation:

$$L_i^* = \begin{cases} B_i^*, & \text{if screening value}_i \leq 10 \text{ ppmv} \\ 10^{\hat{y}_i + e_i^*}, & \text{if screening value}_i > 10 \text{ ppmv and} < 10{,}000 \text{ ppmv} \\ P_i^*, & \text{if screening value}_i \geq 10{,}000 \text{ ppmv} \end{cases}$$

i = 1,..., n, where n = number of connectors with 10 < sv < 10,000 and where:

$\hat{y}_i$	= predicted value from the regression equation for component I (where screening value > 10 ppmv)
e_i*	= pseudo-random normal observation
B_i^*	= randomly selected bagged value where its screening value was ≤ 10 ppmv
P_i^*	= randomly selected bagged value where its screening value was ≥ 10,0000 ppmv

Step 6: Repeat steps 1 through 5 10,000 times to derive an array of 10,000 means

Step 7: From the 10,000 means, construct the median and a 90 percent confidence interval.

A diagram of this approach is shown in the following figure.

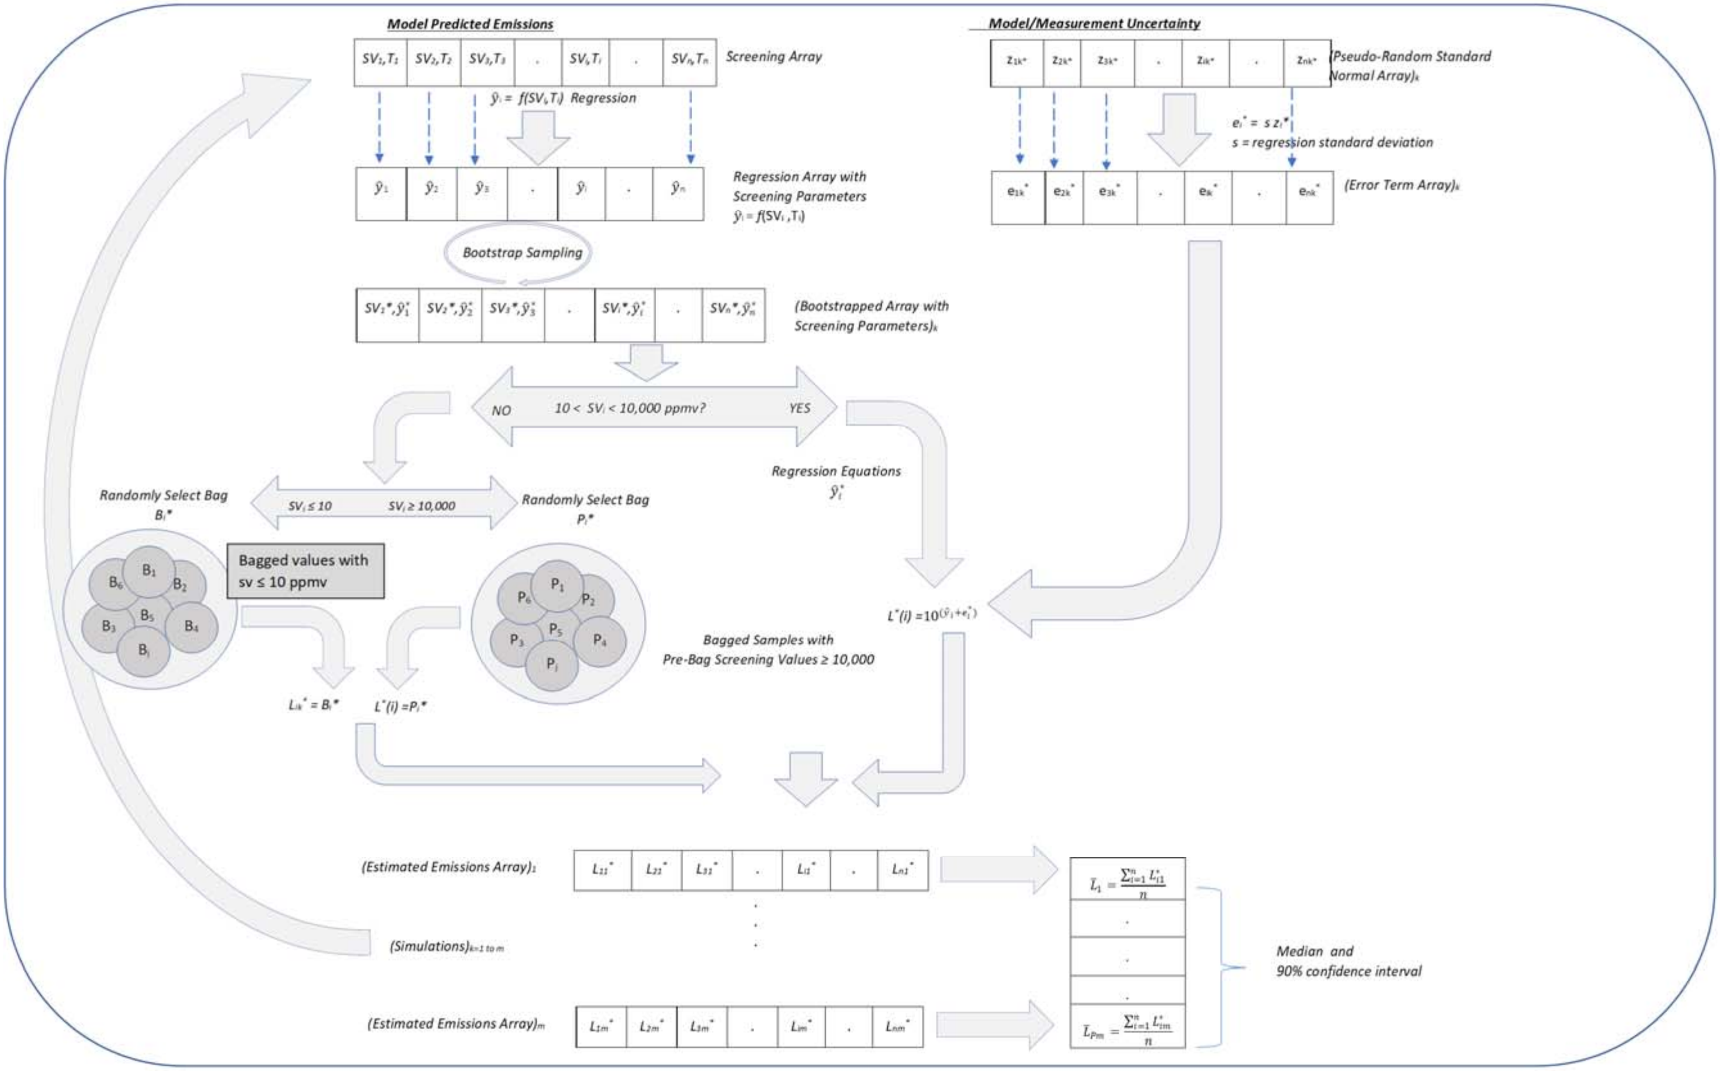

Figure V.iv.4.1. *Estimated Emissions Approach for Valves and Connectors, Scenarios 5-8*

VI. Average Emissions Development

Like the bagged data set, there are numerous considerations regarding the field screening data set for determining which components to include or exclude from an average emissions analysis.

i. Bagged Components

Components that were bagged had emissions measured at the time of bagging. For emissions from bagged components, the emissions that were measured from bagging could be used or emissions could be estimated using the approach discussed in the previous section.

Because of the time that elapsed between initial field screening and bagging, measured emissions during bagging may not actually represent the emissions that would have been measured if the component could have been bagged on the same day as field screening. Because of this, the approach discussed in the previous section was used to estimate emissions from bagged components.

ii. Initial Boiling Point

Some components were screened but were subsequently determined to have an initial boiling point below 302 degrees Fahrenheit. As the intent of the Study was to understand emissions from components in heavy liquid service, which was defined as materials with an initial boiling point of 302 degrees Fahrenheit or greater, components that did not meet this criterion were excluded from further analysis even though there were screened.

iii. Leak Detection and Repair Components

At the beginning of field screening, components that were in heavy liquid service but included within a leak detection and repair program had been screened and included in the Study. After Refinery A, a change in Study design was made to exclude future components from the Study so as not to bias Study results low.

The purpose of a leak detection and repair program is to find and repair leaks through routine monitoring. Components are screened with screening results compared against a leak action threshold. If component is found to have a leak with a screening value above this threshold, action is taken by the refinery to mitigate or eliminate the leak. Such action includes tightening or replacing any packing or gasket materials or even replacing the component if needed.

Because these components are routinely screened and repaired as needed, emissions from such components are expected to be much less than identical components in identical service that are not within a leak detection and repair program.

iv. Lube Oil Components

During field screening at Refinery A, it was found that there were a sizable number of components handling non-process lube oil. These components were principally associated with rotating components (pump shafts, compressor shafts, etc.) where lube oil was used for lubrication. These components have not been included in emissions inventories as there was no method for estimating the number of such components. Because emissions from such components were expected to significantly differ from process lube oil and other heavy liquid material streams, it was decided to exclude these components from the Study and determine emissions within a separate study, the Lube Oil Study.

v. Storage Tank Area Components

The current method of estimating the number of components in heavy liquid service for use in emissions inventories does not account for components that are not in process units such as storage tank areas. However, to address a potential concern that excluding such components may bias Study results high, several hundred components within storage tank areas were included within the field screening portion as well as some within the bagging portion of the Study.

vi. Gaseous Phase

While screening at Refinery D, several components with significant leaks were found handling material with an initial boiling point greater than 302 degrees Fahrenheit but in the gaseous phase. Some of the petroleum refineries were monitoring such components within their leak detection and repair programs components while others did not (Refinery D did not). The five petroleum refineries via the Western States Petroleum Association submitted an agreement to the Air District to include such components within their leak detection and repair programs. Because these components would be routinely monitored, have any leaks repaired, and emissions reported using CAPCOA correlation equations for monitored components; including emissions from such components in average emission factors representing non-monitored components would result in an overestimation of emissions.

VII. Results

Using the procedures discussed in Section V, the mean leak rate per component was estimated for two data sets: including components in heavy liquid service that were part of a leak detection and repair (LDAR) program and excluding such components.

Screened components that were in non-process lube oil service, gaseous phase, or steam-quenched seal were excluded from the analysis.

Table VII-1 presents the results of this analysis. The median pump seal leakage rate estimates are around 1.5E-04 kg/hour, an order of magnitude larger than for valves 2.6E-05 kg/hour and connectors 8.7E-06 kg/hour. However, because there are so many more valves and connectors across the refineries, the latter two values will predominate in an estimated total.

These are the estimated mean leakage rates among the components *screened*. There is significant variation in screening values among process units, and the percentage of these units in the five refineries differs from the percentage in the sample. Thus, the mean leakage rates for the five refineries overall will differ from these somewhat. This latter approach has not been used because the data are inadequate.

For example, in the Blending / Tank Farm category, no valves and only one connector were sampled, whereas there are an estimated 2,330 valves and 7,928 connectors located in blending and/or tank farm process units across the five refineries. Thus, computing leakage means weighted by refinery-wide counts would require either additional data or additional assumptions about the variation in leakage rates across general process units.

To get a sense of how much an estimated refineries-wide average might differ, averages were computed weighted by refineries-wide estimated numbers of components in different processing units. Table VIII shows the results. Although the weighted means differ considerably from the simple component means, they are within 90% confidence limits, indicating that there is no statistical difference. That is, although there are statistically significant differences in mean leakage rates among process units, the data are insufficient to make statistically distinct mean estimates.

Table VII-1. Mean Leakage Rate per Component by Component Type

Scenario	Connectors (kg/hour/connector)			Valves (kg/hour/valve)			Pump Seals (kg/hour/pump seal)		
	Point Estimate	Confidence Interval 5%	Confidence Interval 95%	Point Estimate	Confidence Interval 5%	Confidence Interval 95%	Point Estimate	Confidence Interval 5%	Confidence Interval 95%
1	8.69E-06	6.05E-06	1.46E-05	2.58E-05	1.64E-05	4.00E-05	1.42E-04	7.57E-05	4.61E-04
2	8.59E-06	5.86E-06	1.47E-05	2.68E-05	1.69E-05	4.18E-05	1.55E-04	7.77E-05	5.66E-04

Notes:
Scenario 1 excludes gaseous phase components, steam-quenched pumps, and components handling non-process lube oil
Scenario 2 excludes same components as Scenario 1 as well as LDAR components

Table VIII. Mean Leakage Rate Estimates Weighted by Number of Refinery Components

Scenario	Connectors (kg/hour/connector)	Valves (kg/hour/valve)	Pump Seals (kg/hour/pump seal)
1	1.38E-05	1.44E-05	1.63E-04
2	1.40E-05	1.47E-05	1.94E-04

VIII. Other Analyses

i. Large Leakers

Emissions from components in heavy liquid service is dominated by a few large leakers. Over 80 percent of emissions is from approximately two percent of components. Most pump seals were sampled, but only about 10 percent of the estimated number of valves and five percent of the estimated number of connectors were sampled.

The overall distribution of leak rates is skewed. The following figure is a plot of the logarithms of the emissions from connectors, pump seals, and valves relative to the normal (Q-Q plots). If the data were log-normally distributed, there would appear a straight-line relationship.

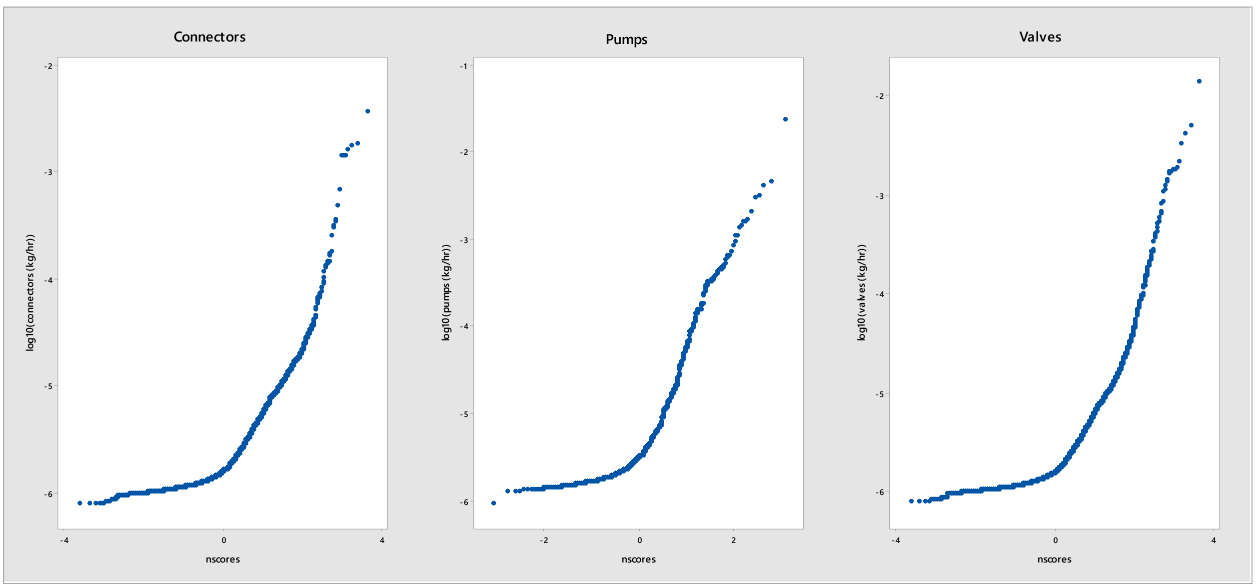

Figure VIII.i.1. Normal Scores Plots for Connectors, Pump Seals, and Valves on Log Scale

As shown in the figure, the plots are right-skewed indicating that it is not well modeled with a log normal distribution.

However, the upper tails of the distribution are roughly linear, as shown in Figure VIII.i.2.

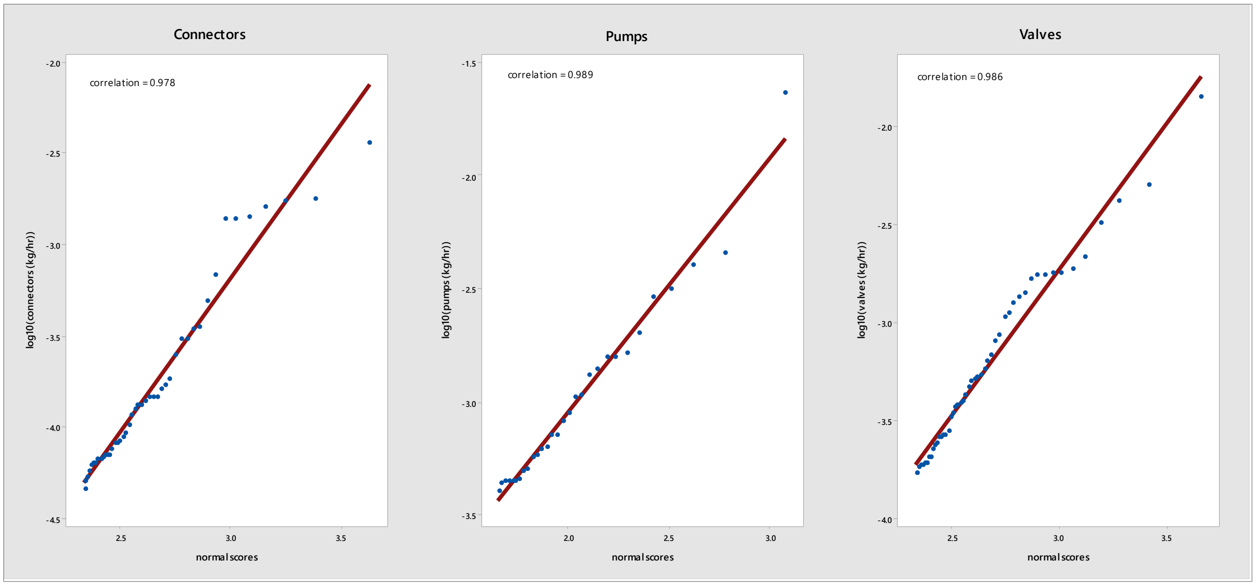

Figure VIII.i.2. Normal Scores Plots of Upper Tails of Connectors, Pump Seals, and Valves

In Figure VIII.i.2, the upper one percent of connectors (45 of 4,487) and valves (51 of 5,079), and the upper five percent of pump seals (30 of 609) are shown against the corresponding normal scores. To test whether these fit the log-normal model, simulations were performed to determine if the correlations are significantly lower than expected if they were from this model.

For connectors, sets of 4,487 log-normal variates were simulated, the 45 largest values selected and the correlation with the same normal scores computed. This was repeated 10,000 times. Of these, 2,134 were smaller than the observed correlation of 0.978 (i.e., a p-value of about 0.21). Based on the data, the log-normal assumption was not unreasonable. Similarly, 7,307 simulated correlations were less than 0.989 observed for pump seals; and 4,089 simulated correlations were less than 0.986 for valves.

Thus, assuming the upper tails of these distributions were log-normally distributed is not unreasonable from the data. Using these distributions can provide an estimate as to how much larger a component leak may be.

An estimate of μ and σ can be made by the intercept and slope of a regression of the tail values against the normal scores. The regression lines are shown in Figure VIII.i.2.

Distribution of the largest leaker

Using the regression estimates, $\hat{\mu}$ and $\hat{\sigma}$, the cumulative probability distribution of the maximum leak rate, M, can be estimated with $P(M < x) \approx \Phi(\frac{x-\hat{\mu}}{\hat{\sigma}})^N$, where N is the total estimated number of components among the five petroleum refineries: 900 pump seals, 191,000 connectors, and 52,000 valves.

The probability density function of the kth order statistic from a set of n independent and identically distributed random variables, $X_1, X_2, \ldots, X_n$ with a continuous distribution with CDF F(x) and pdf f(x) is:

$$\frac{n!}{(n-k)!(k-1)!} f(x)[F(x)]^{k-1}[1-F(x)]^{n-k}.$$

If the Xi are distributed as N(μ,σ), then the density is:

$$\frac{n!}{(n-k)!(k-1)!}\frac{1}{\sigma}\phi\left(\frac{x-\mu}{\sigma}\right)[\Phi\left(\frac{x-\mu}{\sigma}\right)]^{k-1}[1-\Phi\left(\frac{x-\mu}{\sigma}\right)]^{n-k},$$

where ϕ and Φ are the pdf and cdf of a standard normal random variable.

Letting z = (x-μ)/σ, then x = μ + σz, and dx = σdz, so the expected value of the kth order statistic, $X_{(k)}$, is:

$$E(X_{(k)}) = \int_{-\infty}^{+\infty} x\frac{n!}{(n-k)!\,(k-1)!}\frac{1}{\sigma}\phi\left(\frac{x-\mu}{\sigma}\right)\left[\Phi\left(\frac{x-\mu}{\sigma}\right)\right]^{k-1}\left[1-\Phi\left(\frac{x-\mu}{\sigma}\right)\right]^{n-k}\mathrm{dx}$$
$$= \mu + \sigma\int_{-\infty}^{+\infty} z\frac{n!}{(n-k)!\,(k-1)!}\phi(z)[\Phi(z)]^{k-1}[1-\Phi(z)]^{n-k}\mathrm{dx} = \mu + \sigma E(Z_{(k)}),$$

where $Z_{(1)}$, $Z_{(2)}$, …, $Z_{(n)}$ are order statistics from a sample of n iid standard normal random variables. That is, the expected values of the order statistics are a linear function of the normal scores and, hence, μ and σ can be estimated by the intercept and slope of a regression of the $x_{(k)}$ against $E(Z_{(k)})$.

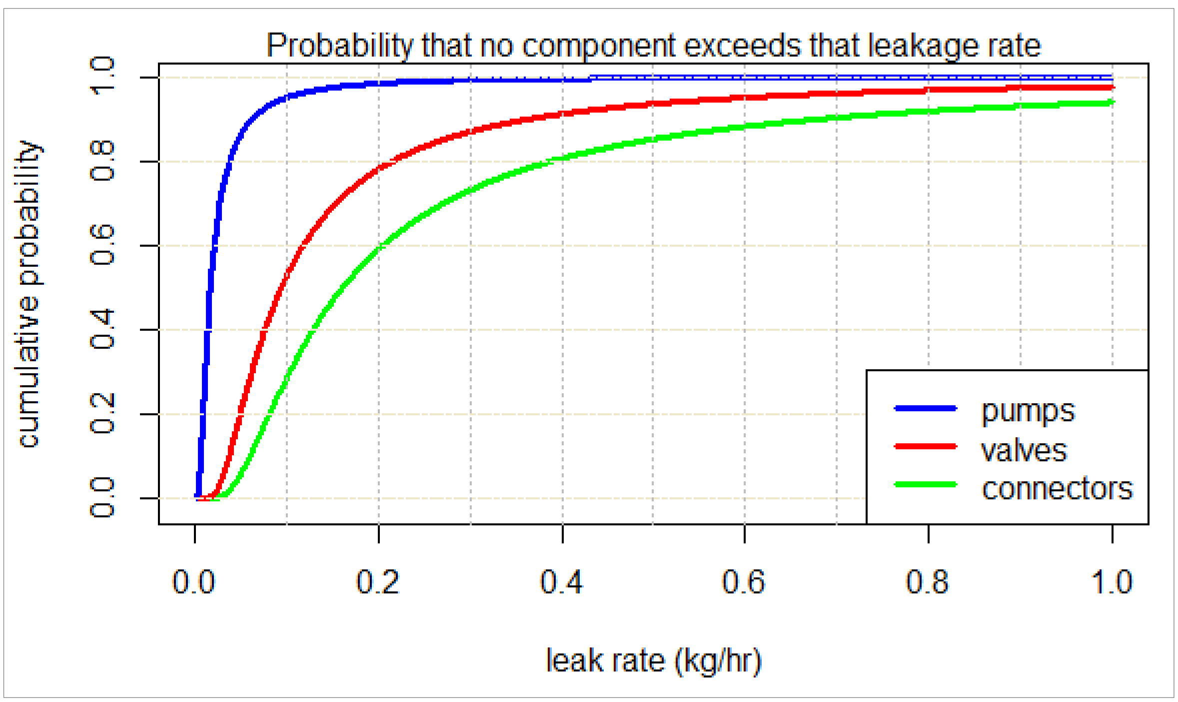

Figure VIII.i.3. Cumulative Distribution of Maximum Leakage by Component Type (Pump Seals, Valves, Connectors)

Figure VIII.i.3 shows there is a 70 percent chance of one of the petroleum refineries' connectors leaking more than 0.1 kg/hour and a 40 percent chance of the maximum being greater than 0.2 kg/hour. For valves, there is a close to 50 percent chance of leaking more than 0.1 kg/hour and a 20 percent chance of leaking more than 0.2 kg/hour.

Although pump seals leak considerably more than connectors or valves on average, their maximum leakage is lower because there are not nearly as many; there is a less than 10 percent chance of a pump leakage rate greater than 0.1 kg/hour.

ii. Impact of Bag Measurement Error on Leakage Analysis

Replicate bag measurements were made, affording an opportunity to estimate the error from this source and the extent that it affects the regression equations, and the benefits if any of using the means of the replicate measurements rather than just using the primary or replicate measurements.

The replicates were done either in parallel, where the leakage stream was split into A and B channels; or sequential, where an A sample was taken followed by a B sample. Presumably, the sequential samples would have a larger error, including the potential additional short-term measurement variability in the leakage stream (e_{ls}), which would be independent of the purely measurement error (e_m).

The regression equations are of the form:

y = a + b*x + c*temp + e

where:

y	= $\log_{10}$(bagged results, kg/hour),
x	= $\log_{10}$(screening value, ppmv),
temp	= operating temperature (degrees Fahrenheit), and
e	= error.

The error term is affected by several things, including the uncertainty in the bagged measurements, but also the measurement errors in screening and temperature and the imperfect relationship between screening and bagged values.

If error is considered $e = e_m + e_{ls} + e_{other}$, the bagged measurement error is independent of the other errors, so that the variance of e is the sum of the variances: $\sigma^2 = \sigma_m^2 + \sigma_{ls}^2 + \sigma_{other}^2$.

Thus, if by estimating σ^2, σ_m^2 and σ_{ls}^2; the relative impact of the latter on the former can be derived.

Figure VII.ii.1 a) shows a plot of y versus x for all bagged components and Figure VII.ii.1 b) shows the paired measurements.

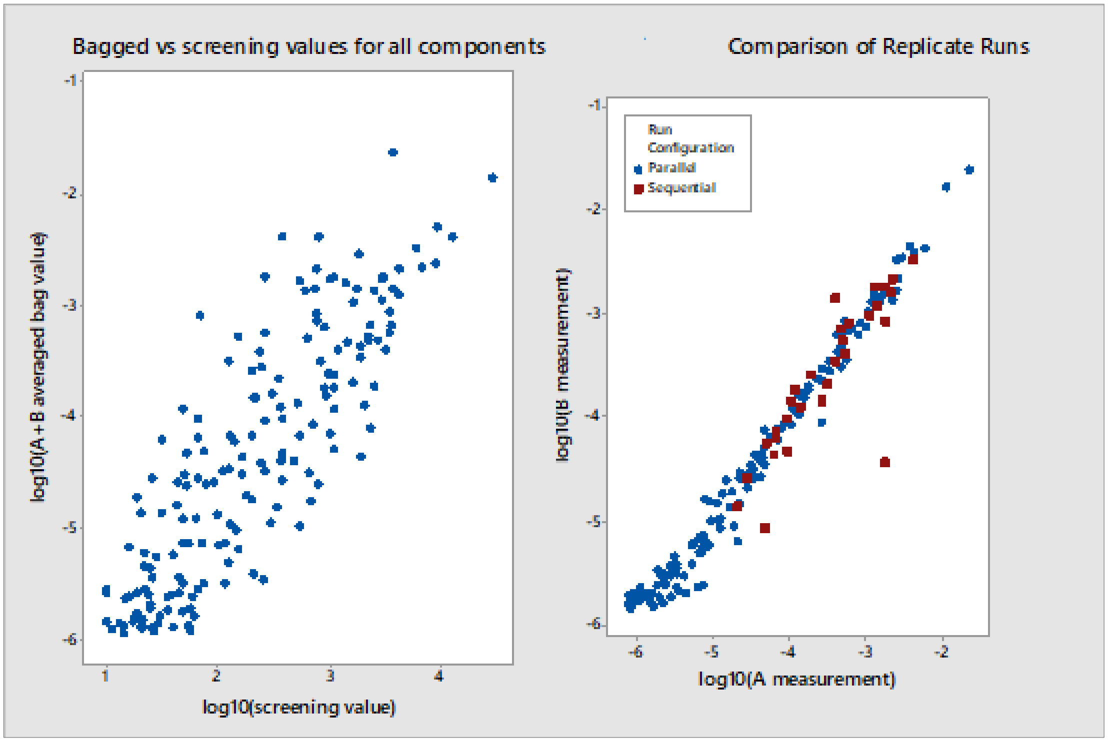

Figure VII.ii.1. a) Plots of logarithm of bagged results versus logarithm of screening results, b) Comparison of Replicate Runs

As shown in the figures, there is more spread in Figure VII.ii.1 a) than in Figure VII.ii.1 b), indicating that σ^2 is much larger than $\sigma_m^2 + \sigma_{ls}^2$.

Replicate Measurements Conducted in Parallel

Numerical results for primary and replicate measurements taken in parallel were derived by first determining the differences in the 144 A and B parallel pairs:

$Z_i = \log_{10}(\text{B measurement}_i) - \log_{10}(\text{A measurement}_i)$, i = 1…, 144.

An estimate of σ_Z^2 with the Z_i (mean of the squares), results in $\hat{\sigma}_Z^2 = 0.0285.$ Because $\sigma_Z^2 = 2*\sigma_m^2$, σ_m^2 can be estimated: $\hat{\sigma}_m^2 = 0.014.$

Replicate Measurements Conducted Sequentially

The differences of the 31 sequential samples were first computed:

$W_i = \log_{10}(\text{B measurement}_i) - \log_{10}(\text{A measurement}_i)$, i = 1…, 31,

and the mean of the squares, then $\sigma_W^2 = 2*\sigma_m^2 + 2*\sigma_{ls}^2$.

The latter term can be estimated as $\hat{\sigma}_{ls}^2 = (\hat{\sigma}_W^2 - \hat{\sigma}_Z^2)/2$.

Using the mean of W_i^2, $\hat{\sigma}_W^2 = 0.1391$.

If an apparent outlier, A009, is removed, variance decreases considerably to $\hat{\sigma}_W^2 = 0.0485$.

With this, σ_{ls}^2 is estimated: $\hat{\sigma}_{ls}^2 = \frac{.0485 - .0285}{2} = 0.010$.

It should be noted that the log transform appears to overcorrect for variability, that is, the variability of the smallest observations in Figure VII.ii.1 b), is greater than the large ones.

However, since no sequential observations were very small, this suggests that the leakage stream variation is actually larger vis-à-vis the pure measurement variation.

Because the sequential samples include both sources of error in the bag measurement process, a comparison of the regression error was made.

As discussed in the sections above, regressions were done separately for pumps and for valves and connectors.

Because there was no statistical difference between the measurement uncertainties between the components, the estimated variance based on the sequential samples was used, namely, for the A measurement of the sequence, $\sigma_A^2 = \sigma_W^2/2$, which was estimated to be $\hat{\sigma}_A^2 = \frac{\hat{\sigma}_W^2}{2} = \frac{0.0485}{2} = 0.024$.

Using the primary (A) measurements alone to derive the regression equations, estimates of σ and σ^2 were obtained from the eight regression scenarios depicted in Table III.iii-1.

Results are shown in the following tables.

Table VII.ii-1. Comparison of Bagged Measurement Variance with Total Regression Error Variance for Valves and Connectors

Variances	Regression Scenarios							
	1	2	3	4	5	6	7	8
Using Only Primary (A) Measurements								
$\hat{\sigma}$	0.428	0.423	0.415	0.413	0.431	0.425	0.416	0.413
$\hat{\sigma}^2$	0.183	0.179	0.172	0.170	0.186	0.181	0.173	0.171
$\hat{\sigma}_A^2$	0.024	0.024	0.024	0.024	0.024	0.024	0.024	0.024
$\hat{\sigma}_A^2$ as % of $\hat{\sigma}^2$	13.1	13.4	13.9	14.1	12.9	13.3	13.9	14.1
Using Mean of Primary (A) and Replicate (B) Measurements								
$\hat{\sigma}_{mean}$	0.417	0.412	0.404	0.400	0.426	0.420	0.411	0.406
$\hat{\sigma}_{mean}^2$	0.174	0.170	0.164	0.160	0.181	0.176	0.169	0.165
$\hat{\sigma}^2 - \hat{\sigma}_{mean}^2$	0.009	0.009	0.009	0.010	0.004	0.005	0.004	0.006

Table VII.ii-2. Comparison of Bagged Measurement Variance with Total Regression Error Variance for Pump Seals

Variances	Regression Scenarios							
	1	2	3	4	5	6	7	8
Using Only Primary (A) Measurements								
$\hat{\sigma}$	0.641	0.644	0.612	0.623	0.601	0.608	0.563	0.575
$\hat{\sigma}^2$	0.411	0.415	0.375	0.388	0.362	0.369	0.317	0.330
$\hat{\sigma}_A^2$	0.024	0.024	0.024	0.024	0.024	0.024	0.024	0.024
$\hat{\sigma}_A^2$ as % of $\hat{\sigma}^2$	5.8	5.8	6.4	6.2	6.6	6.5	7.6	7.3
Using Mean of Primary (A) and Replicate (B) Measurements								
$\hat{\sigma}_{mean}$	0.635	0.638	0.599	0.608	0.604	0.611	0.559	0.569
$\hat{\sigma}_{mean}^2$	0.403	0.408	0.359	0.370	0.364	0.373	0.312	0.324
$\hat{\sigma}^2 - \hat{\sigma}_{mean}^2$	0.008	0.007	0.016	0.018	-0.003	-0.004	0.005	0.007

For valves and connectors, bag measurement error represents 13% to 14% of the regression error variance; and for pump seals the bagged measurement error variance represents 4% to 6%.

When using the mean of the primary (A) and replicate (B) measurements[11], this should in theory reduce the regression error variance:

$\sigma_{mean}^2 = (\sigma_m^2 + \sigma_{ls}^2) /2 + \sigma_{other}^2 = \sigma_A^2 /2 + \sigma_{other}^2$.

Thus, the reduction in regression error variance should be approximately $\sigma^2 - \sigma_{mean}^2$, or $\sigma_A^2 /2$, roughly 0.024/2 = 0.012.

From Table VII.ii-1, the valve and connector differences range from 0.004 to 0.010, with a median of 0.0075.

From Table VII.ii-2, for pump seals, the differences have a wider range, from -0.004 to 0.018, but the median is 0.007.

Both are below 0.012, but in the ballpark.

This indicates that there is a small gain in precision by using the means of the primary (A) and replicate (B) measurements.

[11] The A measurements are only used for those where the A and B measurements were made sequentially. For the sequential samples we use the A measurement. Therefore, the reduction in variance would be somewhat less than 50%.

iii. Repeated Sampling

Nine of the components were bagged twice, ranging between 3 and 44 days apart. This provides some information on the extent that component leakage changes over time. The leakage amounts may change substantially, and there is some data to suggest that leakage tends to increase over time.

The following figure shows data on the log scale. Both the bagged measurements and the prior screening values are shown.

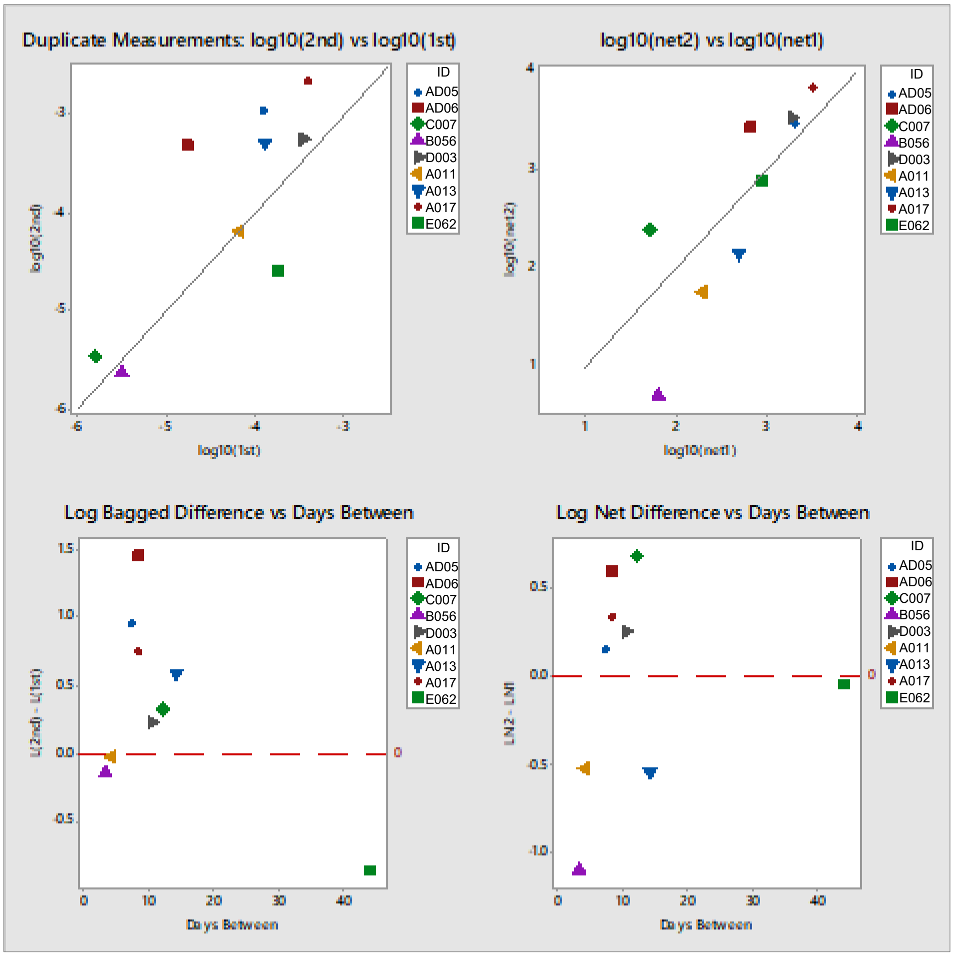

Figure VII.iii.1. Plots of Repeated (Duplicate) Measurements Results

For both, there is a reasonably strong correlation between the two measurements – around 0.8, but the variation is much larger than for simple measurement error. It is readily apparent that the leakage rates vary over time.

The bagged leakage rates can increase substantially, with four values with a log difference greater than 0.5, that is, greater than $10^{0.5} \approx 3$, including the largest leaker, A017.

Except for two measurements with the shortest days between and the measurement with the longest, all the other bagged differences are positive. The two with the shortest days have bagged measurements close to zero, although the net values show a larger negative difference. Note, however that these are also two of the three smallest net values as can be seen in the upper right plot. The net values on the original scale were (63,5) and (192,57), so there is greater measurement error.

APPENDIX D-2
Statistical Software and Program Code

Software

Leak Rate Estimates

The following code loads data sets (screening and bagging), determines regression equations ("Correlation Equations"), and estimates emission rates through use of the regression equations, bootstrap sampling, and simulation.

```
#  Compute correlation equations for pumps and use these to simulate leakage rates

#  Input:  Bagged data ("bagged data final.rdata")
#        Screening data ("screening data final plus bagged")
#        Functions used ("leak rate funcitons.r")

setwd("C:/projects/Heavy Liquid Study/final data")

source("leak rate functions.r")

load("bag data final.rdata")  #  Data loaded to bagsall

load("screening data final plus bags.rdata")  #   Data loaded to w0

#                                  COMPUTE CORRELATION EQUATIONS for 8 scenarios

pumpcorreq <- CorrelationEquations(bagsall,"Pumps")[[1]]   #    pumpcorreq has the estimated coefficients, their standard errors, and other regression info for the correlation equations for pumps

valveconnectorcorreq <- CorrelationEquations(bagsall,"valves and connectors")[[1]]   #    pumpcorreq has the estimated coefficients, their standard errors, and other regression info for the correlation equations for pumps

#                                  SIMULATE PUMP, CONNECTOR AND VALVE LEAK RATES using the correlation equations

lp <- SimulateLeakRates(w0,pumpcorreq,bagsall,"Pumps")  #                    lp contains 10,000 simulated mean pump leak rates for each scenario

simulated_pump_emissions_quantiles <- apply(lp,c(2,3),function(x) {quantile(x, c(.05,.5,.95),na.rm=TRUE)})

lc <- SimulateVnCLeakRates(w0,valveconnectorcorreq,bagsall,"Connectors")  #               lc contains 10,000 simulated mean connector leak rates for each of 32 scenarios.  These include bootstrap sampling from the screening data.
simulated_connector_emissions_quantiles <- apply(lc,c(2,3),function(x) {quantile(x, c(.05,.5,.95),na.rm=TRUE)})

APPENDIX F
Comments and Responses

APPENDIX F-1

Email Transmittal dated December 17, 2021, from Kevin Buchan, Senior Manager of Western States Petroleum Association, Re: WSPA Comments on “Fugitive Emissions from Petroleum Refinery Equipment in Heavy Liquid Service” Draft Report, November 2021

Kevin Buchan
Senior Manager
Bay Area Region Regulatory Affairs

December 17, 2021

Pam Leong
Director, Engineering Division
Bay Area Air Quality Management District
375 Beale Street, Suite 600
San Francisco, CA 94105

sent via email: PLeong@baaqmd.gov

Re: WSPA Comments on "Fugitive Emissions from Petroleum Refinery Equipment in Heavy Liquid Service" Draft Report, November 2021

Dear Ms. Leong,

The Western States Petroleum Association (WSPA) is a non-profit trade association representing twenty-six companies that explore for, produce, refine, transport and market petroleum, petroleum products, natural gas and other energy supplies in California, Arizona, Nevada, Oregon, and Washington. Our members in the Bay Area have operations and facilities regulated by the Bay Area Air Quality Management District (BAAQMD or District).

WSPA appreciates the opportunity to review the District's November 2021 draft report, "Fugitive Emissions from Petroleum Refinery Equipment in Heavy Liquid Service" (draft HLS report).

WSPA acknowledges that the draft HLS report's average emission factors appear to be reasonably consistent with the data collected during the study and qualitatively consistent with other studies done since 1980[1]. The factors are much more realistic than the 1980 factors that the District started requiring all of the refineries to use for inventory and fees in 2013 and 2014.

The District has stated that it will have the response to WSPA's comments completed by the end of January 2022. WSPA has asked for a meeting in February 2022 to allow for WSPA and

[1] Specifically, the 1996 API study showed average emission factors that were substantially lower than the factors estimated in 1980, and the statement in the 1999 CAPCOA/CARB statewide guidelines that components in heavy liquid service "not [be] included in component counts used for the quantification of fugitive emissions".

the District to discuss any issues highlighted through the District's response to WSPA's comments. After participating in this five year study, WSPA expects the opportunity to meet with the District and discuss the District's draft response to WSPA's comments.

Within the HLS we have noted several statements that are unclear. We have also identified errors and omissions, numerical calculations and graphs without much explanation of their significance (making it unclear what exactly the District intends to infer from them), and critical information mixed in with minutiae without a clear delineation between them. We also noticed there are many concepts which are repeated throughout the study yet the reason for repeating the information is not clear and does enhance the report readability and/or purpose. And as agreed upon, the data should be blinded.

WSPA has organized many of its primary comments below by subject; additional detailed comments are included in Attachment A to this letter.

A. Context of Emission Factors

Given that the emission factors are very small numbers and the number of components is very large, WSPA recommends that some context be provided. For example, applying the emission factors to the listed equipment counts shows that total emissions from the 368,795 valves, pumps, and connectors in heavy liquid service at the refineries is approximately 36 tons per year (TPY). This is obviously substantially lower than the emissions reduction estimate in the District's staff report that was used to justify promulgation of the 2015 Rule 8-18 amendments.

Specifically, the District estimated in the Staff Report that 1,227 TPY of emissions reductions could be obtained from that same equipment by removing the District's exemption of this equipment from leak detection and repair (LDAR) requirements.[2] The data shows that the District's estimate was clearly incorrect.

B. "Joint Study" Characterization

While we appreciate the acknowledgement that WSPA, its member companies, and their contractors have contributed a great deal of their time and expertise to this study. However, WSPA has raised concerns with transparencies issues during the report development process, such as: not allowing WSPA to communicate directly with the District's field personnel and statistician with regard to technical matters pertinent to the field work and statistical work, being responsive to WSPA's comments, and sharing its reasoning/thoughts regarding the discussion and conclusion sections of the draft HLS report prior to issuing it.

---

[2] BAAQMD, "Petroleum Refinery Emissions Reduction Strategy: Staff Report", October 2015.

C. Study Purpose

The purpose of the study is a function of the background. The draft HLS report presents background information in Section I.i, but mischaracterizes the information. For example, the District incorrectly states that District staff used 1980 emission factors *as "required"* by the CAPCOA Guidelines, and incorrectly identifies the Board's adopting resolution direction regarding the HLS as being "to conduct a joint study with affected refineries to measure mass emissions from components in heavy liquid service and re-visit the cost effectiveness determinations made with the revised rule".[3]

The study's actual background is as follows:

- In 2014, at the time of permit renewal, District staff began requiring that emissions from components in heavy liquid service be based on 1980 average emission factors, in spite of the fact that the 1999 CAPCOA Guidelines stated that such components "are not included in component counts used for the quantification of fugitive emissions"[4] and that the District's own guidance did not (and still does not) say to include components in heavy liquid service.[5]

  This unsupported direction from the District substantially increased emissions inventories at several refineries. District staff required refineries to agree to the change and pay the associated increased permit renewal fees or else risk not having their permits renewed.

- In late 2014 and early 2015, there were multiple meetings between WSPA, its member companies, and District staff regarding this issue. WSPA identified concerns that use of the 1980 factors did not reflect good engineering judgment. On March 9, 2015, District staff acknowledged that in the past, different District refinery permit engineers had not interpreted the methodologies consistently, and identified that the District would

[3] The actual wording of the Board's adopting resolution (No. 2015-12, "A Resolution of the Board of Directors of the Bay Area Air Quality Management District Adopting Proposed Amendments to District Regulation 8, Rule 18: Equipment Leaks; and Adopting a CEQA Negative Declaration for the Project," Dec. 15, 2015) was for staff to "examine emission reduction and cost effectiveness issues related to the inclusion in Regulation 8, Rule 18 of requirements for monitoring of components in heavy liquid service, and to report back to the Stationary Source Committee prior to July 2017 regarding the results of the examination together with recommendations for modifying the rule if appropriate based on the results".
[4] CAPCOA/CARB, "California Implementation Guidelines for Estimating Mass Emissions of Fugitive Hydrocarbon Leaks at Petroleum Facilities", February 1999, p. 23.
[5] BAAQMD, Source-Specific Guidance for Petroleum Refinery Fugitive Emissions, Section 3.4 of the Permit Handbook (various revisions, since at least as far back as 2015).

prepare a proposal to conduct actual measurements at Bay Area refineries to resolve the disagreement and submit a draft within two weeks.[6]

- District staff subsequently used the 1980 emission factors to justify proposed revisions to Rule 8-18, making these revisions the most significant portion of staff's Refinery Emissions Reduction Strategy.[7]
- On December 15, 2015, the Board promulgated those rule revisions.
- On December 17, 2015, the District e-mailed WSPA the first draft of the 43-page measurement protocol that had been mentioned in the abovementioned meeting on March 9. Clearly, the origin of this protocol predated the Board's adoption of the rule revisions.

WSPA and its member companies filed suit (over Rule 8-18 and other related rules), and the ensuing settlement agreements with the District refer to this Heavy Liquid Study. Details in the settlement agreements include the following:

- "Parties agree that pending completion of the Heavy Liquid Study and the establishment of new emissions factors based on the results of the Heavy Liquids Study, the interim Heavy Liquids Emissions Factors depicted [below] will be utilized for purposes of complying with and enforcing Rule 12-15, as well as for all other District purposes, including but not limited to, emissions permit fees and rule-making."[8]

  The table of emission factors lists eight component types, and all eight should be identified in the HLS report along with a clear explanation of which are and aren't being covered by the study, given that the HLS is redefining some of the types (e.g., flanges as a subset of connectors), subdividing others (non-process lube oil service vs not), not addressing all of the eight types, and (in the current draft) recommending some but not all of the remaining types for further study. The District also needs to explain what it is proposing to do with regard to emission factors for component types listed in that agreement that are not addressed in the study.

- Following completion of the data collection activities at each refinery, the District was supposed to "meet with the refinery managers and/or other designees of the Petitioners at each refinery participating in the Heavy Liquids Study to discuss the data collection process, any issues encountered, exchange lessons learned and best practices

[6] Notes from this meeting were e-mailed from Guy Bjerke (WSPA) to BAAQMD staff on March 16, 2015.
[7] Staff estimated 1,227 TPY of TOG reductions from the Rule 8-18 amendments, out of 2,224 TPY of TOG reductions from the entire suite of rules (BAAQMD, "Estimated Emissions Reductions and Costs for Rule Changes in Phase One", Table 8 of the Petroleum Refinery Emissions Reduction Strategy: Staff Report, October 2015, p. 13).
[8] Settlement, Enforcement, and Release Agreement for *WSPA, et al. v. Bay Area Air Quality Management District*, case number N16-0963 (regarding Rule 12-15), March 2018, pages 3 and 11.

related to data collection from equipment in heavy liquid service, and work to mutually resolve any issues in order to facilitate completion of the Heavy Liquids Study", and the HLS report was supposed to document that.[9]

Particularly, the draft HLS report does not reflect the issues encountered and lessons learned from that field work. This information should be accurately documented in the next revision of the HLS report. WSPA sees the accurate sharing and written documentation of this information to be a key step towards furthering scientific study and minimizing future misunderstandings of technical issues.

D. Pejorative Statements/Misrepresentations

The draft HLS report contains several unsupported statements that cast aspersions and mention or infer a substantive bias, that are at best misleading and at worst completely false. Accordingly, WSPA requests that these statements either be substantially revised to be accurate or removed from the report altogether. These include the following:

1. The statement on page 46 that industry's request to monitor components in lube oil service at the first refinery "introduced a potentially significant bias into the Study" is completely false.[10]

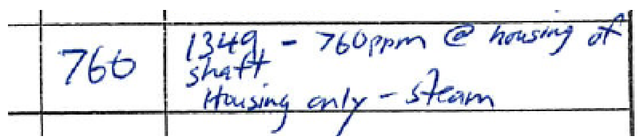
   None of the components that the District wanted to have screened were omitted, and all of the lubricating oil screenings were (a) explicitly identified as such and (b) listed out individually in WSPA's subsequent 2017 "Low Volatility Finished Products Protocol" that was approved by the District. WSPA's consultant has previously reminded the District to exclude these components, but it does not appear that these were entirely excluded from the District's analysis.[11] We realize that given the relatively small number of points, the average emission factors will not be significantly affected by revising the analysis to exclude them. However, if the District is now asserting

[9] Enforcement Agreement and Agreement to Stay Litigation for *Valero, et al. v. Bay Area Air Quality Management District*, case number N16-0095 (regarding amendments to Rules 6-5, 8-18, and 11-10), March 2017, p. 4.
[10] It was recognized in early 2016 that lubricating oils are less volatile than most other substances, but had not been exempted from the District's 8-18 revisions or subsequent 8-18 implementation plans. Prior to and during the beginning of the study, WSPA had repeatedly sought clarification from the District as to whether components in lube oil service were going to be excluded from the emissions inventory, and the District was nonresponsive. As the study was progressing throughout the first refinery, WSPA's concern was that the District was going to presume that the work it was doing on process units—often at higher temperatures and containing more volatile streams than lubricating oils—was applicable to lubricating oils as well, and that the District was going to complete work at the first refinery without actually screening any components in lube oil service.
[11] Appendix B-1 does not identify which screening values were excluded, but the latest data spreadsheet that WSPA received from the District in September 2021—which does show exclusions—did not appear to have excluded all of the components listed in the "Low Volatility Finished Products Protocol".

"potentially significant bias" as a result of these points, all they need to do is exclude them completely and redo the analysis, which would then eliminate that concern.

2. On page 99 and several other places in the report, there is mention of the steam-quenched pump screened at 760 ppm from "a foot or more" or "over a foot" away that is alternately described as "dripping" (p. 99), leaking a "steady stream" (e.g., p. 221, 228, 234), and sometimes "spewing" (p. 103, 179) "liquid hydrocarbons" that were "pooling at the base of the pump".

   This is not consistent with what personnel who were on-site recall, nor is it reflected in the District's actual field notes that were shared with WSPA at the time, which state only that 760 ppm was measured[12] "@ housing of shaft" and that there was "steam" (which often drips and forms pools):



760	1349 - 760ppm @ housing of shaft Housing only - steam

   A leak/pool of liquid *hydrocarbons* also seems unlikely for several reasons: i.e., if there was truly a liquid hydrocarbon leak of this magnitude, (a) District field personnel should have attempted to capture some of it, estimate the liquid leak rate (which would have been easy if it were that large a leak), and had the sample analyzed; and (b) this would have presented a safety concern that the refinery would have wanted to address. These unsubstantiated characterizations should be deleted from the report.

3. Pages 46 and 146 refers to 39 times in which the contractor had to make holes in the bag, and identifies that "In these cases, either ambient air was pulled into the tent and through the sampling media or component leakage was emitted out of the tent". Page 223 of the draft HLS report refers to those same 39 cases and states that "If ambient air was drawn into the enclosure, it may have introduced a bias to the sample."

   EPA's vacuum method is <u>supposed</u> to draw ambient air into the enclosure, regardless of whether a hole is cut or not, because a vacuum pump is being used.[13] Usually, the bags are not airtight; however, if they are (or are close to it), the vacuum pump could collapse the bag onto the component. Testers alleviate this by cutting a small hole, as specified in EPA's method.

[12] Refinery personnel's check of the reading with their own TVA was recorded minutes later as 258 ppm, but did not identify the exact monitor location.

[13] As WSPA pointed out as far back as 2016, there is potential <u>high</u> bias associated with using the EPA vacuum method <u>in general</u>, when contaminated air is drawn in, but that bias is independent of whether holes needed to be cut.

4. The first of the four “issues uncovered” in the Executive Summary (p. ES-4) and Conclusions (p. 243) is that “Study design may have impacted results (there is a greater probability of missing larger leakers)”. This statement requires more explanation, including but not limited to specifying what this is relative to; i.e., there is a greater probability of missing large leakers with this study than with….what? It appears to be referring to a statement on page 230 (which in turn refers to Appendix D-1) that “there is a high probability that the Study did not capture large connector or valve leaks (i.e., the distribution of screening values for the screened connectors and valves does not reflect the actual distribution).

   This may be attributed to the selection process for connectors and valves.” However, WSPA did not find this discussion in Appendix D-1, it is not clear what “actual distribution” is being referred to, and it is not explained why such a discrepancy would be attributed to the selection process (as opposed to simply a very small number of high leakers), all of which needs to be corrected.

5. The second of the four “issues uncovered” in the Executive Summary (p. ES-4) and Conclusions (p. 243) is that “Screening of heavy liquid streams causes screening instruments to drift low (measured screening values are lower than actual).” There is no mention of the fact that the District analyzed the extent of that drift and showed that it had a very minor impact (pp. 199-208), and therefore was not corrected for (p. 222).

   If the District thinks that this is such a significant issue, it should correct for the bias; if not, this should either be removed as a “key issue uncovered” or the District should either reference the magnitude of the impact where this is mentioned in the Executive Summary and Conclusions – e.g., “ Screening of heavy liquid streams causes screening instruments to drift low (measured screening values are lower than actual), but the degree of drift was predominantly within pre-established criteria and was not considered to be significant enough to warrant quantitative drift correction”.

6. The third of the four “issues uncovered” in the Executive Summary and Conclusions is that “Screening pace was faster at Refineries B, C, D, and E, which may have impacted measured screening values (and resulting estimated emissions).” Again, this sounds speculative, and necessitates more explanation.

   Screening values can be impacted by screening pace, but emissions (measured by bagging) are not. Pace at the beginning of the Refinery A screening survey was slower than during the screening that was subsequently done immediately prior to bagging, which means that the emissions analysis biases emissions from the initial Refinery A components high (as opposed to biasing emissions from the other components low).

7. The Executive Summary identifies a “safety stand down” as the reason why the District stopped using its own screening inspectors and using the refineries’ instead, which is discussed further with several unsubstantiated statements on page 60 that are not germane to the study. WSPA requests that such statements be removed.

8. This statement on page 100 reads as though the District is biasing the results low, and does not appear to be accurate: “Although screening instruments had the capability of and did show concentrations greater than 10,000 ppmv, because instruments were not calibrated with a standard gas above 10,000 ppmv, the maximum screening value shown in results is 10,000 ppmv.”

   In fact, it appears that all of the actual screening values that exceeded 10,000 ppmv values are shown in Appendix B (none were truncated to 10,000 ppmv), and several tables also show a column for “> 10,000” ppmv.

9. On page 233 there is a statement that “the minimum bag vacuum requirement (0.001 inches H_2O) was met by all samples. However, a pressure gauge with a resolution of 0.005 inches H_2O was used in sampling. It is not clear how lower measurements were identified.”

   This statement infers that the District may not understand this process. It is important to understand that the gauge was an analog gauge with tic marks every 0.005 inches of water column (which is not the same as “resolution”); when the gauge needle is in between tic marks, the tester visually interpolates, as is typical for analog gauges.[14]

E. <u>Screening Methodology/Observations</u>

As recognized by the draft HLS report, screening value measurements can depend on a number of methodological factors, which include but are not limited to the speed at which the screening monitor is moved, the length of time it is held in one spot, and the proximity of the probe tip to the source. These factors, along with the requisite frequency of calibrations and drift checks, also significantly impact the cost of monitoring that the District is going to be evaluating.

The District’s initial screening was problematic, with very slow movement and hold times, multiple monitor breakdowns (list prices for new monitors can be in the neighborhood of $10K-

[14] We would agree that these are not *precise* readings; however, our understanding of field practice for this method has been that they strictly look for a sustained movement in the needle off of zero. Accordingly, we did not find mention of this “minimum bag vacuum requirement” in either the EPA method or the original version of the BAAQMD Protocol; and it was added – based on the values that had been recorded at the first refinery – to a revised version of the Protocol in 2017.

$20K),[15] monitors sometimes taking hours to return to background levels after monitoring (not just the much shorter times shown in Table II-12 of the draft HLS report), and some very large discrepancies between readings taken by different people monitoring the same component. The District subsequently modified its methodology over the course of the study[16] to at least partially mitigate those problems – including changes in monitoring speeds and automatically swapping out monitors if elevated concentrations were found (another added cost)—but these changes and their timing are not divulged (and in some cases are inaccurately stated) in the draft HLS report.[17] The HLS report needs to divulge the details of these issues, both for purposes of cost implications and improving future studies.

The draft HLS report also omits mention of a key concept associated with the screening methodology that explains several of the findings in this study and therefore is important to include in the revised report, both for purposes of analyzing the results of this study and planning future ones. While the report recognizes the problems associated with steam condensing in the monitors (for steam-quenched pump seals), it fails to point out the much more widespread issue that heavy hydrocarbon liquids at high temperatures are prone to condensing in screening monitors and their probes.[18]

This is the reason for the slow response times and "clear times" noted on pages 49-50, 67-71, 99, and 220, and may also contribute to the apparent "drift" issues mentioned on pages 68-69 and 222 (which can result from calibration gas getting adsorbed by heavy liquids that are adsorbed on the probe wall and/or recalibrating instruments with zero gas when they still have some residual adsorbed hydrocarbon, rather than true "drift"). This deposition is also why monitors needed to be swapped out after readings higher than specified values (something that should be mentioned in the draft HLS report): i.e., people sometimes had to flush the monitor for hours to clear out the deposited material. On the other hand, if there is insufficient cooling in the probe, hot material can reach the detector and damage the monitor, which only has an

[15] See, for example, https://www.ierents.com/category-s/480.htm and https://www.cbrnetechindex.com/Print/6196/thermo-fisher-scientific-inc/tva-2020-toxic-vapor-analyzer.

[16] The protocol used at the beginning of the study was dated November 2016; revised versions were dated February 9, 2017, April 28, 2017, July 21, 2017, and November 15, 2017. Additional details were provided at the beginning of 2018 in the form of request for bids for 3rd party contractors and in-person training February 26, 2018, but less formal communications made over the course of the study, including but not limited to several decisions made at the beginning of the study (in 2016) and e-mails from Linda Duca on March 8, 2018 and March 16, 2018.

[17] There is recognition on p. 199 that "The number of unique screening instruments used at each refinery varied from seven to twelve instruments" (for two screening teams), but the text does not explain why so many instruments were needed.

[18] See, for example, US EPA, "Inspection Manual: Federal Equipment Leak Regulations for the Chemical Manufacturing Industry, Volume I: Inspection Manual", EPA/305/B-98/011, December 1998, p. 4-8.

operating range of -10 to 45 °C (14-113 °F).[19] These problems were exacerbated by the study's specification to always hold the monitor's probe tip closer to components than required by Method 21 (exposing it to the hottest temperatures) and hold it in place for an extended period of time, and that should be recognized in the report.

This does not impact the accuracy of the ultimate mass emissions results, given that the screening values are just indicators; i.e., the factors that influenced the screening survey values also influenced the screening values that were taken immediately prior to bagging, so factors that influence the screening values "cancel out" as long as the survey screening methodology was reasonably consistent with the pre-bagging screening methodology. And the fact that there is a correlation between the measured emissions rates and the screening values immediately prior to bagging also validates the concept of estimating emissions using screening values (even if the screening values are influenced by a number of variables).

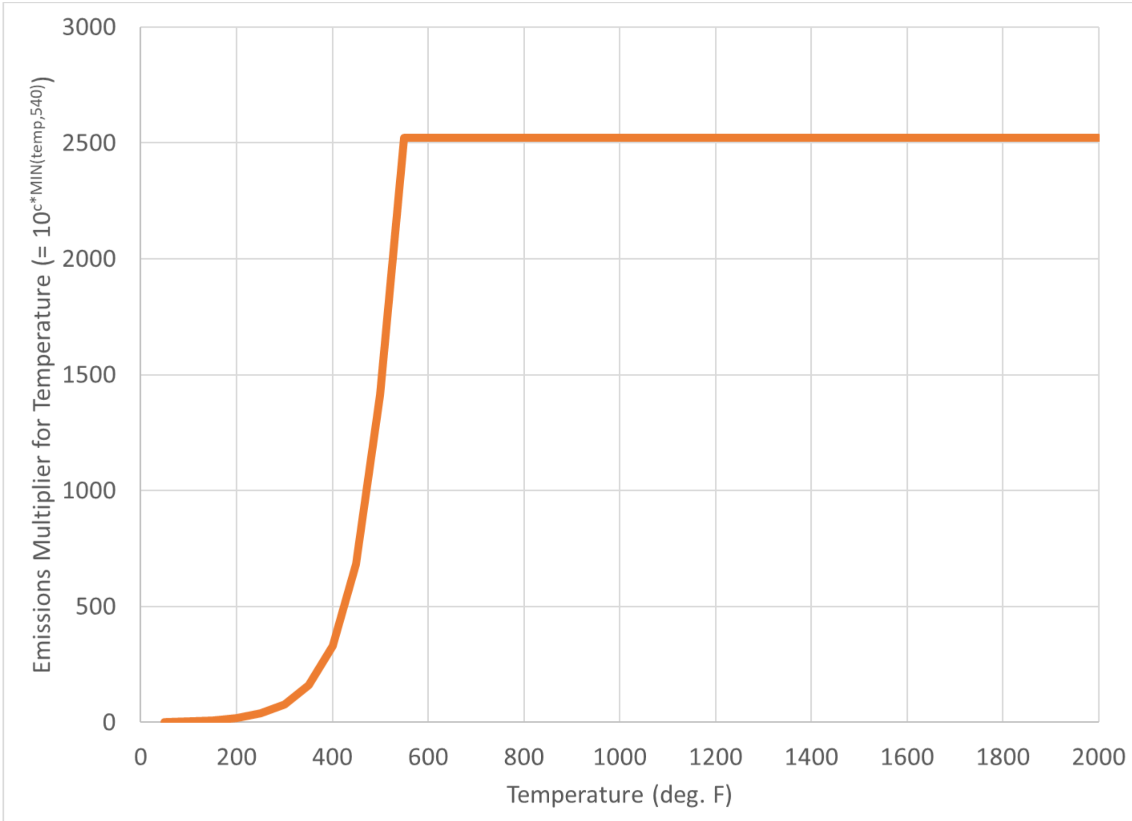
F. Analytical Approach

Correlation equations are needed to estimate the mass emissions rates that correspond to each of the measured screening values which are then combined to determine average emissions rates. The need for correlation equations was mentioned extensively by the District between 2016-2020, and while the abstract to the draft HLS report refers to correlation equations, those equations are not identified in the report.

As shown previously by EPA, WSPA, and CARB, the first step towards developing correlation equations is to do linear regression in log-log space, which the District did. The District added an additional term for temperature because there was a statistically significant dependence and including that term reduced residuals. WSPA understands why this was a first step, but repeatedly asked the District to reconsider or refine that inclusion. There are several reasons that WSPA is still asking for the inclusion of correlation equations:

- While the portion of the equation that includes temperature is a simple line in log-log space, when the equation for emissions (as opposed to the log of emissions) is written, temperature is an exponent, and that form of the emissions equation shows an unrealistic dependence on temperature that is not sufficiently supported by the data or scientific principles. As WSPA has stated previously to the District, and shown below for the temperature exponent c = 0.0063 shown in Table III-61: i.e., for a given screening value that occurs at different temperatures, the District's equation identifies that the emissions are proportional to the factor on the y-axis.

[19] Thermo Fisher Scientific, "TVA2020 Instruction Manual, Toxic Vapor Analyzer, Part Number 11755-00, 15Dec2014".



- The component temperature data themselves are not very high quality. There was no guidance regarding the specifics of temperature monitoring in the protocols provided to the screeners, baggers, and 3rd party observers,[20] and the District appears to have filled in missing component temperature data by simply setting them equal to "operating temperature" data (even though there is considerable scatter in the correlation between those temperatures, and Figure III.i.2.6 of Appendix D.1 illustrates a difference between "operating temperature" and component temperature).

- The addition of the temperature dependence adds complexity and makes the equation less useful for purposes outside of this study (i.e., it could only be used to calculate mass emissions if screeners also had the time to collect temperature data).

[20] These details include the fact that (1) the laser "spot" is a guide but not necessarily right where the temperature is being read from, (2) readings depend on what kind of metallic (or insulating) material the temperature gun is pointed at (and its thickness), (3) it matters whether the temperature gun is pointed at the surface where a leak is (i.e., the part that would be exposed to the ambient air), some component upstream, etc. Page 50 of the draft HLS report mentions pointing the temperature gun "at the innermost point of [a] flange" (as shown in Figure II.3), but this was not in the protocols and appears to be impossible to follow, given that the actual in-use flanges are bolted together, and the point shown in the figure would not be accessible (i.e., it would be obscured both by the flange lip and the gasket).

- The temperature correlations appear weak (as shown in Figure III.i.2.6 of Appendix D.1 below) – in particular, too weak to support the current form of the equation over other forms for temperature that might make more sense (e.g., ones where the effect of temperature changes with screening value) – and it does not appear that they appreciably improve the results.

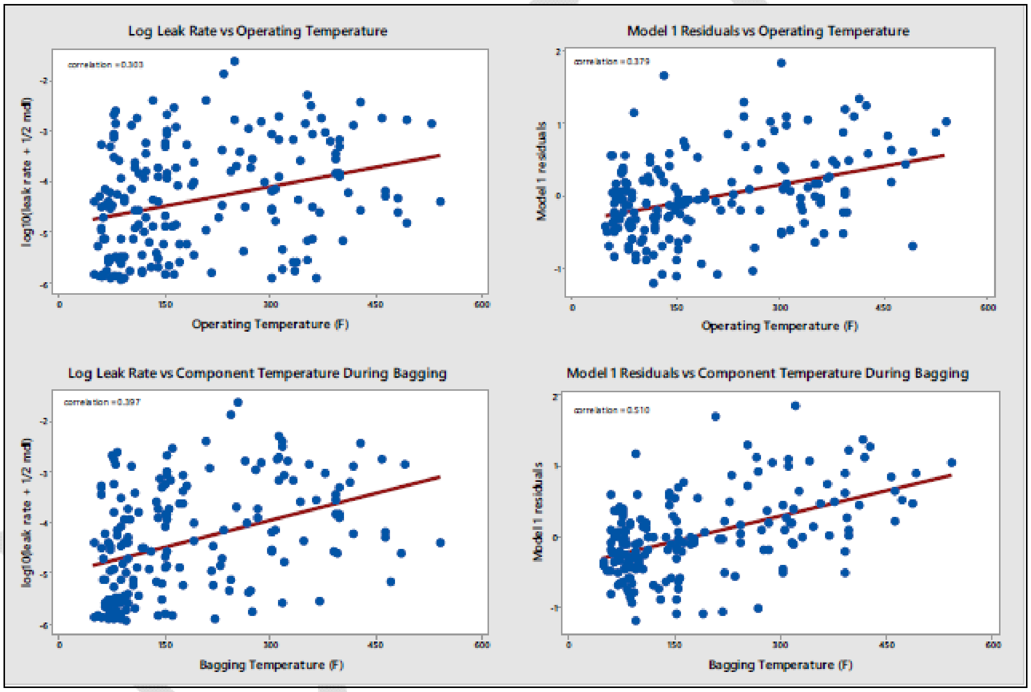


Figure III.i.2.6. Temperature Compared with Measured Leak Rates and Model 1 Residuals

The second step towards developing correlation equations – in previous studies by EPA, WSPA, and CARB – was then to adjust the linear regression lines for the scale transformation The District opted to not adjust for scale transformation explicitly—in part because of a claim that a certain distribution was necessary, and use a bootstrapping approach instead. WSPA finds the writeup in Appendix D.1 confusing and the draft HLS does not clearly identify,

- Which of the eight scenarios shown in Tables IV-4 and IV-5 was eventually used to determine average emissions (page D-1-27 identifies which ones had "the highest adjusted R2 and lowest sigma", but does not specify that these were the scenarios used, and none of the parameters match those shown in Table III-62 on page 177); or

- Any quantitative intermediate calculations/sample calculations showing how the District arrived at the emission factors using the regression equations.

Because there are several calculations being made, a key check that was explicitly discussed and agreed to by the District in 2018, was to make sure than when each correlation equation was applied to the corresponding screening values measured prior to bagging, it agreed reasonably well with the actual measured emissions rates for those bags. (It could also be compared to other studies' correlation equations.) Although the District appears to have predicted emissions rates for each component, the draft HLS report appears to be missing this validation check.[21] We ask the District to provide in the HLS report the correlation equations used to estimate the mass emissions rates from screening values, provide the estimated mass emissions rates, and do the validation check.

Another key aspect of the study was that components in gas-phase service were supposed to excluded. The whole purpose of that agreement was technical in nature, pointing out that a vapor leak is very different from a liquid leak and can potentially have a nearly unlimited flowrate whereas a nondripping leak from a component in liquid service is limited by the rate at which the liquid volatizes.

Accordingly, the understanding was that the District would exclude components in vapor service from the analysis of components in heavy liquid service if the refineries agreed to classify these as components in "vapor" service (and included in their existing LDAR programs), and that is reflected in the draft HLS report text. However, it is not clear that the District has actually excluded those points from the analysis: i.e., both the data table in Appendix B-1 and several of the data summaries appear to include these components—two of which had screening values of over 10,000 ppm and two of which had screening values of 2,263 ppm and 1,749 ppm[22]--while others (such as Table III-64) seem to have excluded them.

Please provide the table of mass emissions rates that were calculated for the screening values in the valve/connector category that were used to calculate the average emission factor for valves.

G. Summarized Conclusions

WSPA appreciates the fact that the District did generate average emission factors for connectors, valves, and pump seals (excluding steam-quenched pump seals) in heavy liquid service (except non-process lubricating oil service) that appear to be reasonably consistent with the data. However, given how low the emissions are, we do question the conclusion that there

[21] We recognize that there is a comparison of the applying the regression equation to the screening values; however, as expected, this results in a predicted value that is biased low, and the regression equation alone does not incorporate the bootstrapping.
[22] The District was provided with a list of components in vapor service that had been screened (and in some cases bagged), and these included D-178, -192, -491, -499, -796, -802, -806, -808, -810, -864, -868 and -915. (D-499, which is one of the over-10,000 ppm components, is also misclassified as a "valve" when in fact it was a pilot-operated PRV.)

is a “need” to develop methodologies for estimating relatively small numbers of these components.

Most of the other listings of “Results”, “Issues Uncovered”, and “Recommendations” seem like odd choices for section headers, several of which are not described by the headers they are under. WSPA would be interested in the “improvements…in…screening, and sampling techniques”, but the “improvements” listed in Section IV.viii are not supported and do not reflect the lessons that should have been learned with regard to those techniques (see “Methodology” comments above). Several of the recommendations in that section appear to focus on things that provide more data and reduce some aspect of variability (such as screening distance or response time) without having acknowledged the overarching lessons from this study, such as:

- Clear and unambiguous communications and decision-making are imperative for complex studies involving multiple parties.
- Definitions are important to identify clearly and unambiguously in advance; confusion on this point can get compounded. We have had numerous discussions regarding how to categorize bonnet flanges on valves, what kinds of equipment counts as a PRD for purposes of air emissions, what counts as being “heavy liquid” versus “vapor” service, whether to record one screening value per pump assembly (including connectors), per pump (highest value taken for all seals), or per pump seal, etc., what counts as a “steam-quenched” pump, and what the “non-process lube oil” category that the District exempted from the study explicitly includes.

  Page 85 also notes that “Because of the number and diversity of component subtypes, a standardized listing of subtypes was not identified or provided to field personnel and subtype categorizations were left to the field personnel completing the standardized field data sheets.” Lack of consistency in definitions results in lack of consistency in data and analysis. Clear definitions for component types should have been included in the District protocol. And if subtypes are too diverse/numerous/specialized to be consistently categorized, that begs the question of (1) the validity of any analysis based on recorded subtype information and (2) why that information was even recorded.

Given that the instruments are not designed for heavy liquids at high temperatures, and because of the deposition problem mentioned in our comments above and the variability in the liquids being monitored, it is not feasible to develop uniform “instrument response times to various materials at different temperatures before study” to “provide to screening personnel for use in screening” as identified in the draft HLS report. Response times will depend on a wide array of variables, including not just material type (which will vary), but also concentration, how long the equipment probe is held at that concentration, etc. This will make it infeasible to simply have an easy "look up table" of precise response times. Instead, it should be recognized that handheld monitors are screening tools, that can be used to distinguish between leaks of different orders of magnitude, but for which there are no "true" values (e.g., to the extent they depend on wind speed at the location of the component) and for which the consistency in readings is going to be limited for a number of reasons beyond the things that can reasonably be controlled.

We have provided additional detailed comments in Attachment A and welcome follow up discussions on our comments with your staff. Thank you for the opportunity to comment on this important matter.

Sincerely,

Kevin Buchan

Enclosure: Attachment A, Additional Detailed Comments

ATTACHMENT A. ADDITIONAL DETAILED COMMENTS

1. Abstract page ii. The objective identified in the abstract (p. ii), on page 1, and on page 5 are all worded slightly differently, with the first two mentioning an objective to "understand" emissions and the last more specifically stating that the primary objective is to answer the question, "What are the average emission rates for the Bay Area refinery components in heavy liquid service?" The first two explain the recommendations of "improvements…for future studies" including things such as vibration monitoring. However, the Board directive focuses upon specific objectives, and does not mention a need to try to "understand" component fugitives. The statements of objective should be made consistent, and should reflect applicable language in the Board direction and agreements between the District and WSPA as mentioned in our comment letter.

2. Abstract pg ii identifies that "measurements were used to develop correlation equations using linear regression analysis", but as mentioned in our letter, the correlation equations are not identified in the report. If equation [III-2] on page 176 is the correlation equation and the parameters that are in Table III-61 are the parameters for that correlation equation, then they should be identified as such; and if they aren't, the correlation equations need to be shown.

3. The abstract (p. ii) identifies that "the emissions averages resulting from this study are lower than commonly used emission factors developed by the United States Environmental Protection Agency for components in heavy liquid service", with the implication that this was the latest word on the subject. It should also mention the more recent and relevant fact that (1) the 1999 CAPCOA/CARB "California Implementation Guidelines for Estimating Mass Emissions of Fugitive Hydrocarbon Leaks at Petroleum Facilities" (cited by the District's own Permit Handbook) identified that components in heavy liquid service "not [be] included in component counts used for the quantification of fugitive emissions", and that accordingly the District's Permit Handbook doesn't list average emission factors for components in heavy liquid service.

4. (Pg xiii) The Glossary should include a definition of "in Heavy Liquid Service" (separate from just "Heavy Liquid") to document that this means the component is in contact with the heavy liquid itself, not the vapor coming off of it.

5. (Page xiv) The Glossary definition of "Pressure Relief Valve" has two pictures and the bottom one appears to be incorrectly pointing to a bonnet flange as a connector. The report appears to goes back and forth between the terms PRV and PRD interchangeably – it should be consistent as much as possible, and generically use the more generic term (PRD) to avoid missing any PRDs that are not PRVs.

6. The Glossary should include a definition of "steam-quenched pump" to avoid confusion. Given that the District was unwilling to base this on observation, we had previously mentioned API Schedules 61 and 62. However, if the District is interested in defining the status pump seals, there are some cases in which there are pumps with two seals where one of the seals appears to be steam-quenched and one does not.

7. Page ES-1 of the Executive Summary states that "The Board's adopting resolution directed Air District staff to conduct a joint study with affected refineries to measure mass emissions from components in heavy liquid service", and there is a similar statement on page 4. The adopting resolution does not state that; it only states that "the Board of Directors directs staff to examine emission reduction and cost effectiveness issues related to the inclusion in Regulation 8, Rule 18 of requirements for monitoring of components in heavy liquid service, and to report back to the Stationary Source Committee prior to July 2017 regarding the results of the examination together with recommendations for modifying the rule if appropriate based on the results."[23]

8. The Executive Summary (p. ES-2) shows Table ES-1, "Estimated Population by Component Type".

    a. This appears to be the population that was in Heavy Liquid Service and should be labeled as such.

    b. This also appears to be the population estimate from 2015. Given the amount of detailed information that the District has received in each refinery's 2016-2020 Rule 12-15 submittals, a more recent estimate should be provided.

    c. Given the confusion that has been previously discussed it is not clear if the "pump" count is the number of pumps, or the number of pump seals.

    d. For consistency with the rest of the Report, the pressure relief device (PRD) count should exclude the count of PRDs that are in vapor service (where the vapor is coming off heavy liquids). Information in the report indicates that 30 PRDs were screened and it is not clear if that number reflects PRDs that are actually in heavy liquid service.

9. The Executive Summary (p. ES-3) mentions that "Process units were first selected using process flow diagrams provided by each petroleum refinery. After selecting process units, individual process lines were identified from petroleum refinery-provided piping and instrumentation diagrams." It should clarify that the District selected both the process units and the process lines.

[23] BAAQMD Resolution No. 2015-12, "A Resolution of the Board of Directors of the Bay Area Air Quality Management District Adopting Proposed Amendments to District Regulation 8, Rule 18: Equipment Leaks; and Adopting a CEQA Negative Declaration for the Project," Dec. 15, 2015, p.4.

10. On page ES-5 (and page 244), the section titled "Recommendations" states that "There were several component types for which average emission rates could not be derived either because there were insufficient numbers, their emissions could not be evaluated, or they are recommended for inclusion in a future study" – pressure relief valves that relieve to atmosphere, pump seals with steam or hot oil quenching systems, and components handling non-process lube oil. It should be clarified which ones are which: e.g., that the PRVs had insufficient numbers, the steam-quenched pumps could not be evaluated, and the lube oils were recommended for inclusion in a future study. For steam-quenched pumps, it should be acknowledged that WSPA did propose to get the best information possible with available monitoring equipment; however, the District identified that they did not agree with this, and also declined to specify what they would recommend.

11. With regard to the "future study" of components handling "non-process lube oil", the Report should recognize that WSPA developed the protocol, the District approved it, and the emissions data were provided to and quality-assured by the District in 2019. In addition, definitions continue to be important: "non-process lube oil" is shorthand for "low-volatility finished products", which were explicitly defined as

    > "finished products having an initial boiling point greater than 302° F that are being used for their intended purpose including, but not limited to, hydraulic fluids, glycol in transmitter loops, seal fluid, MEA, DEA, and lubrication oil used to lubricate, including but not limited to pumps, compressors and other rotating equipment"

    or

    > "finished lubricants and base oils that require no further processing, other than blending, to produce finished lubricant products, and are at an operating temperature of less than 200° F".

    To prevent confusion, this explicit definition should be included in the HLS Report (i.e., the Glossary).

12. Pages 7-13: This historical information prior to 1980 seems too outdated to be relevant to this study and is not referenced anywhere else in the Report and should be deleted.

13. The background information in Section I.i identifies the District's assertions that (1) with regard to CAPCOA's 1999 exclusion list—i.e., CAPCOA's language was that "the following components are not included in the components counts used for the quantification of

fugitive emissions"[24]—the exclusion only pertained to *regulatory inspection programs*, and that (2) "By default, those components would be required to use [the 1980] average emission factors" (p. 5). The District's assertions here are,

- contrary to the abovementioned language used in the CAPCOA document (as well as the language at the beginning of that section, which states that "In order to accurately calculate fugitive emissions from leaking equipment using the new correlations **and emission factors**, it is essential that users identify and count components in the same way. This section defines and illustrates how components are to be counted for use with the new **emission factors**." [emphasis added];
- not supported by any language in the CAPCOA document; and
- not supported by any language in the relevant section of BAAQMD's own Permit Handbook that cites the CAPCOA document ("Petroleum Refinery Fugitive Emissions/Emission Calculations").[25]

In addition, if the District's asserted interpretation were accurate, that would imply that the District would be required to use the 1980 average emission factors for the other 12 types of components in the CAPCOA exclusion list as well, which it does not.

14. Section I.i mentions the 1996 study on emissions from components in Heavy Liquid Service but fails to divulge any of the conclusions from that study. It should divulge the emission factors from that study, or at least the fact that the emission factors that were well below the 1980 emission factors.

15. Section I.iii identifies the previous studies, and there are subsequent comparisons with the 1980 study with regard to average emission factors, but there does not seem to be a comparison with regard to all the evaluations the 1980 study made with regard to the effect of temperature, pressure, diameter, etc. It would be particularly useful to both (a) make those comparisons and (b) summarize that information, so that future studies might not have to re-look at "everything under the sun" as potentially impacting the results.

16. On page 31, Table II-2, the ownership history of the refineries, has no relevance to the Study and should be removed.

17. On page 46 and elsewhere, refinery A is referred to as the "pilot refinery", and there are inferences that procedures were the same throughout the testing of that refinery. In fact, the procedures were changed very early on at that refinery, such that at the end of the testing they were much more similar to those at refineries B-E than at the very

[24] CAPCOA/CARB, "California Implementation Guidelines for Estimating Mass Emissions of Fugitive Hydrocarbon Leaks at Petroleum Facilities", February 1999, p. 23.
[25] BAAQMD Engineering Division, "Permit Handbook" (various revisions), Section 3.4.

beginning. At the time, there was no indication that this refinery was going to be a "pilot", nor are the data being treated any differently (i.e., the District's analysis of average emission factors lumps all the data together), so please remove this term. "First refinery" would be adequate.

18. Section II.i.6 should include the information in the March 8, 2018 and March 16, 2018 e-mails from staff (i.e., Linda Duca/BAAQMD), which were helpful to field personnel and provided useful clarifications. It should also clarify that sampling was called off when it was raining. WSPA can provide copies of these emails if the District does not have them.

19. Section II.ii. is titled "Sampling Methodology" but describes both screening and sampling and should be titled accordingly.

20. Page 50 shows an IR temperature gun being aimed inside a flange between the gasket and the flange face. There are several issues with this:

    a. This specific direction of where to aim the gun on a flange was not specified in the protocols that were in place at the time that the District inspectors did their work, or in the 2018 protocol that was in place at the time that the refineries/contractors did their work, nor did WSPA observe it in the field

    b. It is unclear how a person would be able to point the laser at such a spot, given that the flange ends are bolted together tightly over the flange (see, for example, Figure II.1 on p. 34).

    c. It should be recognized that the laser spot is an approximation of where the temperature is being measured from; it is not exact (i.e., the temperature is not being read from the exact spot where the beam hits).

21. The precise changes in screening time that were made are not documented in the draft HLS report and need to be.[26] Other changes that were made in the study over time included changing the leak threshold of 2.5 ppm (identified on p. 51) and swapping out monitors whenever a concentration over a specified value was detected.

22. On page 68, a key monitor specification that is not identified is operating temperature range. This should be identified; the TVA has an operating range of -10 to 45 °C (14-113 °F).[27]

---

[26] Page 50 has a statement that "screening personnel were informed that monitoring pace may be dictated by the specific streams being monitored and their operating conditions", but it is still not clear how exactly the personnel used information about the streams and operating conditions to adjust monitoring pace.

[27] Thermo Fisher Scientific, "TVA2020 Instruction Manual, Toxic Vapor Analyzer, Part Number 11755-00, 15Dec2014".

23. In several parts of the Report it is mentioned that "Method 18" was used—including for the evacuated canisters, for which it does not apply—and US EPA Method 18 is included in an appendix; page 62 states that samples were analyzed "following the procedures specified in Section 8.2.4 (Adsorption Tube Procedure)". There is actually very little analytical detail in that Section (or in Method 18 as a whole), and typically not all of the procedures are followed. Among analytical laboratories, the term "Method 18" is often used colloquially to refer to GC work in general. Details of the actual analytical work conducted were provided to and reviewed by the District's source test division. At a minimum, Method 18 should be removed from the appendix, and canister analysis should only reference the relevant "TO" method.

24. Page 72 states that "A Thermo Fisher Scientific TVA1000B was used at the pilot refinery (Refinery A) while a Thermo Fisher Scientific TVA2020 was used at the other refineries." That statement is not accurate – i.e., TVA2020's were used at Refinery A as well (as the District specified in their protocol) - but we are not completely sure whether they were used 100% of the time. This can be confirmed from the District's field sheets, which identified all the TVA #'s used.

25. There is no indication that the "sample train recovery tests" mentioned on page 74 were done – e.g., no data is provided – and this sentence is unclear: "The theoretical amount of methane introduced into the system was calculated using the measured concentrations (introduced and bag measured) and gas flow rates and compared to the amount calculated as collected in the bag, correcting for pressure and temperature." If they were done, please clarify (i.e., how is gas flow rate pertinent) and if they were not done, please remove reference to them.

26. Page 77 states that "a select few [samples] were taken with a XAD tube in series with the charcoal tubes with the XAD tube closest to the component leak". To be clear, all of the initial samples were taken with XAD tubes to comply with the District's original protocol. The test protocol was subsequently revised when it was realized that these tubes (a) were not necessary and (b) created excessive pressure drop. District source test personnel had a good explanation for why the XAD was originally specified, and why they were subsequently dropped and this information should be included in the writeup. Similarly, page 79 indicates that lab results went to only C24, but C30 for condensate; the original version of the District's protocol mentioned taking all analysis out to C30, but this was subsequently scaled back when it was recognized that this was not necessary.

27. Page 85 contains the text that "Component subtype categories were identified for connectors, valves, and pressure relief devices. Because of the number and diversity of component subtypes, a standardized listing of subtypes was not identified or provided to field personnel and subtype categorizations were left to the field personnel

completing the standardized field data sheets. Proper identification and categorization of a component subtype depended upon the familiarity and knowledge of field personnel." Since "proper" identification and categorization is not standardized and is acknowledged as having not been identified, the last sentence should be removed. This is also pertinent to the subsequent analysis of information by subtype; the subsequent tables and figures should be footnoted accordingly.

28. On page 145, there should be some discussion regarding the fact that the act of bagging itself can increase the temperature around the component (compared to when it is open to air; i.e., heat trapping) and cause more emissions than would have otherwise been present, as illustrated by the photos and associated text that WSPA's consultant provided to the District in the past. This also seems to be born out by the results for A09 mentioned on page 212, where a component that was bagged for an extended period of time showed two orders of magnitude more emissions from the bag at the end of the time period than at the beginning of the time period.
29. Page 150 shows how TO-15 results were biased low compared to tube results, and states that "The difference between two figures for the same component is attributed to the difference in sample volumes for the canisters as compared to the sorbent tubes." This statement appears to be flawed. What it should instead identify is that (1) there was a knockout upstream of the canisters and (2) the TO- method is more suited to more volatile components, as less volatile components may stay adsorbed on the canister walls.
30. There does not seem to be any discussion of the graphs on and around page 156, and the casual reader might erroneously infer that (for example) hydrotreaters have more leakers, etc. In fact, what seems more appropriate to conclude—given this study and previous ones—is that (a) there are very few leakers and (b) their location cannot be predicted a priori.
31. Page 179 states that "The five petroleum refineries have agreed to incorporate any components handling a heavy liquid stream in the gaseous phase within their LDAR programs. As such, it will be necessary to have separate average emission factors with and without gaseous phase components." If the components are subject to LDAR, there is no need to have an average emission factor that includes both them and components that are not subject to LDAR. More appropriate language addressing this issue is on page 229 and the language on page 179 should be corrected.
32. At the bottom of page 192, there is a statement that "Using the regression estimates and cumulative probability theory (see Appendix D-1 for a detailed analysis), a cumulative distribution of the maximum emissions by component type was derived and shown in Figure III.66." It is unclear what is meant by "maximum emissions by

component type"—i.e., does it mean maximum measured in this particular study? The subsequent statements that "there is a 70 percent chance of one of the petroleum refineries' connectors leaking more than 0.1 kg/hour and a 40 percent chance of the maximum being greater than 0.2 kg/hour" and "For valves, there is a close to 50 percent chance of leaking more than 0.1 kg/hour and a 20 percent chance of leaking more than 0.2 kg/hour" are also unclear. On the face of it, these seem to be substantially different from the other study results (i.e., if there was really this much leakage, the average emission factors would be orders of magnitude higher). If what was instead meant was e.g. that "at a given refinery, there is a 70 percent chance of at least one connector leaking 0.1 kg/hour", the sentence should be worded that way.

33. On page 196, the conclusion that including the LDAR components actually increases the emission factor rather than reducing it is interesting, but there is probably little to conclude from this more generally given the small number of components in LDAR service that were evaluated (e.g., just one or two leakers could skew the average factor for them).

34. Page 196 incorrectly identifies that the scenarios exclude gaseous phase components and components handling non-process lube oil; as identified by our other comments, they appear to actually <u>include</u> both the components in gaseous phase (which has a significant impact on the results, given the high screening values for several components handling gaseous phase material) and components in "non-process lube oil" service (though these are all very low emitters).

35. Page 200 shows drift check results for calibration gases. However, what would be particularly interesting to know would be (1) what the drift results for the <u>zero</u> gases were (obviously, those can't be expressed as %) and (2) what sequence the drift checks were done in (e.g., was 10 ppm always first). This might potentially shed more light on results.

36. On Page 212, the quotient (primary results – replicate results / average of the two) is not "absolute" difference but the "relative" difference. And the problem with using only this as a metric is that two results that are wildly different—e.g., by an order of magnitude, two orders of magnitude, or three orders of magnitude—will have very similar quotients (close to 200%, because the denominator will be approximately equal to half of the higher value).

37. Page 220 defines screening instrument "response" as "the difference between the measured concentration and the actual concentration of a leak", but there is no "actual concentration of a leak". The actual concentrations in the vicinity of the leak vary spatially and temporally and depend on many factors, including the size of the wetted surface exposed to the air, airflows around that wetted area (including those due to

wind and those due to a monitor's sampling pump), temperature (at the liquid-air interface), and the equilibrium vapor pressures and vaporization rates of the various components of the liquid as a function of temperature. What is going to be recorded by the instrument is going to be a function of those actual concentrations, the sampling pump flowrate, the location and orientation of the probe tip (and the extent to which that location and the pump speed influence the actual concentrations), instrument response time and response factor[28] (both of which can also depend on the substances in the liquid being monitored), the extent to which you have a steady-state situation between the volatization rate from the leak point and the flow going into the probe tip, the extent to which you are outside the monitor's temperature range, and the extent to you lose material due to deposition in the probe and instrument or gain it due to the revolatization of material that was previously adsorbed on to the probe wall/instrument surfaces (both of which are affected by temperature, equilibrium vapor pressures, and volatization rates).

38. The discussion of the justification of the screening methodology on page 220 of the draft HLS report appears to be most focused on obtaining the highest screening value possible, rather than recognizing that these are truly <u>screening</u> instruments – especially in heavy liquids application – where it may be better to do a larger number of screenings quickly than do a smaller number slowly. The report should recognize and acknowledge that for purposes of <u>emissions</u>, what is most important is that the screening methodology used to screen components and the screening methodology used prior to bagging (that is used to relate screening values to emissions rates) are consistent.

39. Pages 221-222 attempt to define the terms screening time and screening pace, but are still ambiguous. The sentence "Screening time is not expected to impact the actual leak concentration but rather what is measured" is unclear, given that there is no "actual" leak concentration – that is purely a function of how the measurement is taken. The Report needs to clarify that in the relatively simple case of something like a flange, the total time needed to screen it is going to be the sum of (1) the time needed to move the probe all the way around the flange (which is in turn a function of the diameter of the flange lip, not the line size) and what would often be referred to as the "pace" (speed of movement around the flange), as well as any obstructions that might require the screener to have to move to a different spot to screen and any other potential interferences; and (2) any additional time needed as a result of finding an elevated concentration: i.e., time needed to locate the point of maximum concentration, and hold it at that point. Our understanding—though it is not clarified in the report—is that this "total time" is the difference between the beginning and end times recorded by the

[28] "Response time" and "response factor" are as defined by EPA Method 21.

screeners for each component. Accordingly, if "pace" as calculated in the Report is that total time by an estimated circumference (i.e., not the same as "pace" as defined above), the "pace" itself is a function of the extent to which a leak was found, and the graphs that seem to imply the difference that the pace makes on the emissions/screening value (p. 144) need to also have some discussion identifying that the emissions/screening value also affects the "pace".

40. On page 226, when providing details regarding sample C004, please add that the vapor was obviously not from a heavy liquid – i.e., this was the sole component for which the overwhelming majority of the sample was C5.

41. Page 227 states that "Typically, the valve bonnet flange is considered by the Air District as a connector." For emissions inventories, this would go against both CAPCOA's statewide guidelines and EPA guidelines (which state the opposite) and the corresponding analyses used to generate the emission factors. If the District did not intend this assertion, a more accurate statement would be that "For purposes of the Air District's leak monitoring requirements in Rule 8-18, the bonnet flange is classified as a connector, as currently specified by Section 8-18-204."

42. Page 227 states that "if a sample only included a bonnet flange and did not include the valve stem, this sample was considered a connector as the valve stem is considered the defining feature of a valve and the location where leaks most often occur". This was never discussed with WSPA, and we were not made aware if this situation ever occurred. A bonnet flange is a flange that is part of a valve, the CAPCOA Guidelines and this study clearly identify that "valve" includes both the stem and any bonnet flanges on the valve. If the District reclassified a valve's bonnet flange as a connector, that would be contrary to the what was agreed upon and this needs to be changed.

43. On page 229, there is a statement that "During the Study, there was a concern that because of the Study design (only two process units were initially selected for screening of connectors and valves), the screening portion may not adequately represent the true distribution of leaks and may exclude potentially significant leaks resulting in lower emissions estimates than actual." Regardless of what was "initially" selected, Table III-63 on page 180 indicates that several process units were sampled from.

44. On page 229, there is a statement that "At Refineries B, C, D, and E; separate entries were made for pump seals". That is false, as we have repeatedly identified. Refinery D made separate entries for each pump seal, but refineries B, C, and E made one entry per pump (highest seal) regardless of how many seals were present. We have provided supporting information to the District previously.

45. On page 230, there is mention of use of a FLIR camera that was terminated "when the petroleum refinery personnel determined more process lines than expected would be

affected and it became a daunting task" that is then followed up with an alternative explanation that "this effort ceased once several components with leaks were discovered with screening values above 10,000 ppmv were identified". The latter is an unsubstantiated statement that appears to be a gross mischaracterization of the fact that FLIR camera readings are often interfered with by heat. In addition, FLIR cameras do not measure either concentrations or screening values. Accordingly, this statement should be removed.

46. On page 232, Table IV-1 is titled "Comparison of Number of Components Screened and Sampled Between 1980 Study and Heavy Liquids Study", but this is inaccurate; i.e., for the 1980 study, this is only the number of components <u>in heavy liquid service</u> that were screened and sampled. The table also mentioned that "The specific number of flanges in heavy liquid service that were screened is not known", but this information appears to be available in Table B2-21 on page 230 of the 1980 EPA study.

47. Page 235 mentions "eight different regression scenarios" but does not identify what those scenarios are, or why they were chosen. It should include the description of the scenarios from page D-1-25 and provide an explanation of why these eight scenarios were chosen. There was a lot of discussion about this topic and yet there seems to be no information in the Report about it; there should be, as this was an interesting topic that might be of some relevance to future studies. One key reason those scenarios were developed was that there appeared to be a substantive difference between emissions rates measured by the District's bagging team and emission rates measured by Tricord, with the former being lower. This was analyzed by the District in Spring 2017 and by others in 2018-19, yet we could not discern a reason for the difference, or assess which sampling crew was likely to be getting the more correct result. Accordingly, when assessing how to deal with duplicate samples taken on the same component, the question arose as to whether to disregard all of the District's sampling entirely (scenarios #3, 4, 7, and 8) or to simply take the first result, whether the District took the data or Tricord did (scenarios #2 and #6). WSPA was against double-counting a component just because multiple samples were taken from it, and so never agreed to scenarios #1 and 5. The other key reason those scenarios were developed was that WSPA had pointed out that the data in the 0-10 ppm range were pretty imprecise (as were many of the results for the 10 ppm cal gas), so it might not make sense for those data to be influencing the regression lines as much as the higher data. So scenarios #1-4 were for linear regression across the full range of data, and #5-8 were for linear regression across just the screening values of 10 ppm and higher. We believe it is more justifiable to make a consistent decision. It appears that the District may have chosen different scenarios for pumps versus other components, and made that choice based on statistical correlation parameters.

48. The District goes through several comparisons of its log-space regression equations with those of the 1980 study – which nobody has been using the regression equations from – and then declines to compare to the regression equations in the 1993 API study (which is also the backbone for the correlation equations in the 1995 EPA Protocol and 1999 CAPCOA guidelines) because "because the intent of the 1993 Refinery Study was to derive new correlation equations rather than average emissions, a random sampling of components was not done. Rather, components within given screening ranges were located and then sampled. Therefore, the 1993 Refinery Study screening results would not be a representative sample as a comparison to those found in the Heavy Liquids Study." That is a completely wrong conclusion. The 1993 API study did the exact same thing that was done in this study: i.e., bagging was done across components based on their screening values (non-random) so that data would be useful for generating correlation equations. This is the reason for the "prioritization" table on page 31 of the November 2017 version of the District's HLS protocol. The District should make the comparison.

49. Page D-1-32 states without explanation that "The distribution of y = log (leak rate) has been demonstrated to not be normal and thus the same approach used in the 1980 EPA Study is not appropriate." The 1980 EPA Study did not use a straight lognormal assumption but instead used "a mixed distribution, specifically a lognormal distribution with a discrete probability mass at zero".[29]

APPENDIX F-2

Response to Comments

General Comments

Comment: “B. “Joint Study” Characterization
While we appreciate the acknowledgement that WSPA, its member companies, and their contractors have contributed a great deal of their time and expertise to this study. However, WSPA has raised concerns with transparencies issues during the report development process, such as: not allowing WSPA to communicate directly with the District’s field personnel and statistician with regard to technical matters pertinent to the field work and statistical work, being responsive to WSPA’s comments, and sharing its reasoning/thoughts regarding the discussion and conclusion sections of the draft HLS report prior to issuing it.”

Response: The Air District and WSPA participated in over two dozen technical calls and meetings where technical matters and rationale were discussed. Technical documents outlining data assumptions and approaches were created and shared with the Technical Working Group, which was comprised of Air District and WSPA members. In addition, the Air District responded to questions from WSPA’s statistician as well as held a call between WSPA's statistician and the Air District's statistician to discuss the statistical approaches and answer remaining questions.

Comment: “Pejorative Statements/Misrepresentations”
"The draft HLS report contains several unsupported statements that cast aspersions and mention or infer a substantive bias, that are at best misleading and at worst completely false. Accordingly, WSPA requests that these statements either be substantially revised to be accurate or removed from the report altogether. These include the following:

1. The statement on page 46 that industry’s request to monitor components in lube oil service at the first refinery “introduced a potentially significant bias into the Study” is completely false.

None of the components that the District wanted to have screened were omitted, and all of the lubricating oil screenings were (a) explicitly identified as such and (b) listed out individually in WSPA’s subsequent 2017 “Low Volatility Finished Products Protocol” that was approved by the District. WSPA’s consultant has previously reminded the District to exclude these components, but it does not appear that these were entirely excluded from the District’s analysis. We realize that given the relatively small number of points, the average emission factors will not be significantly affected “potentially significant bias” as a result of these points, all they need to do is exclude them completely and redo the analysis, which would then eliminate that concern.”

Response: The cited text states "potentially" and the next paragraph in the report addresses how these components were handled ("to remove these components from the Study"). One of the reasons for excluding these components was that they were selected by field observations, which introduces a bias (how were components visually selected?).

These components were excluded from the average emission rate analysis.

Comment: "On page 99 and several other places in the report, there is mention of the steam-quenched pump screened at 760 ppm from "a foot or more" or "over a foot" away that is alternately described as "dripping" (p. 99), leaking a "steady stream" (e.g., p. 221, 228, 234), and sometimes "spewing" (p. 103, 179) "liquid hydrocarbons" that were "pooling at the base of the pump".

This is not consistent with what personnel who were on-site recall, nor is it reflected in the District's actual field notes that were shared with WSPA at the time, which state only that 760 ppm was measured "@ housing of shaft" and that there was "steam" (which often drips and forms pools):

A leak/pool of liquid hydrocarbons also seems unlikely for several reasons: i.e., if there was truly a liquid hydrocarbon leak of this magnitude, (a) District field personnel should have attempted to capture some of it, estimate the liquid leak rate (which would have been easy if it were that large a leak), and had the sample analyzed; and (b) this would have presented a safety concern that the refinery would have wanted to address. These unsubstantiated characterizations should be deleted from the report."

Response: The embedded copy of the field data sheet entry only states the location of the leak ("760 ppm @ housing of shaft") and does not state at what distance the measurement was taken.

The observations were noted and verbally told by Air District personnel who had taken the screening measurement.

A video of the pump in question was recorded at the time of the screening. The video shows material spewing from the pump seal and a noticeable pool of liquid with an oily sheen surrounding the pump at the base.

After extensive discussions with the petroleum refinery as well as with WSPA at the time, a method for safely measuring mass emissions from this pump did not result in an identified method. These discussions included how to measure mass emissions from this pump seal as well as other steam-quenched pump seals.

It is the Air District's understanding that this pump was placed out of service for repair by the refinery in question.

Comment: "Pages 46 and 146 refers to 39 times in which the contractor had to make holes in the bag, and identifies that "In these cases, either ambient air was pulled into the tent and through the sampling media or component leakage was emitted out of the tent". Page 223 of the draft HLS report refers to those same 39 cases and states that "If ambient air was drawn into the enclosure, it may have introduced a bias to the sample."

EPA's vacuum method is supposed to draw ambient air into the enclosure, regardless of whether a hole is cut or not, because a vacuum pump is being used. Usually, the bags are not airtight; however, if they are (or are close to it), the vacuum pump could collapse the bag onto the component. Testers alleviate this by cutting a small hole, as specified in EPA's method."

Response: Page 223 of the report addresses background influence and how background influence may have been mitigated by subtracting results of mass emissions sampling of the background. However, WSPA's comments do not address the scenario of whether the bag was pressurized.

On page 4-4 in Section 4.2.1 (Vacuum Method) of the 1995 EPA Protocol for Equipment Leak Emission Estimates states "However, it is important to maintain a vacuum in the bag, since VOC could be lost through the hole if the bag became pressurized."

Comment: "The first of the four "issues uncovered" in the Executive Summary (p. ES-4) and Conclusions (p. 243) is that "Study design may have impacted results (there is a greater probability of missing larger leakers)". This statement requires more explanation, including but not limited to specifying what this is relative to; i.e., there is a greater probability of missing large leakers with this study than with….what? It appears to be referring to a statement on page 230 (which in turn refers to Appendix D-1) that "there is a high probability that the Study did not capture large connector or valve leaks (i.e., the distribution of screening values for the screened connectors and valves does not reflect the actual distribution).

This may be attributed to the selection process for connectors and valves." However, WSPA did not find this discussion in Appendix D-1, it is not clear what "actual distribution" is being referred to, and it is not explained why such a discrepancy would be attributed to the selection process (as opposed to simply a very small number of high leakers), all of which needs to be corrected."

Response: Both the report and Appendix D-1 have been revised to provide more discussion regarding large leakers.

Comment: "The second of the four "issues uncovered" in the Executive Summary (p. ES-4) and Conclusions (p. 243) is that "Screening of heavy liquid streams causes screening instruments to drift low (measured screening values are lower than actual)." There is no mention of the fact that the District analyzed the extent of that drift and showed that it had a very minor impact (pp. 199-208), and therefore was not corrected for (p. 222).

If the District thinks that this is such a significant issue, it should correct for the bias; if not, this should either be removed as a "key issue uncovered" or the District should either reference the magnitude of the impact where this is mentioned in the Executive Summary and Conclusions – e.g., " Screening of heavy liquid streams causes screening instruments to drift low (measured screening values are lower than actual), but the degree of drift was predominantly within pre-established criteria and was not considered to be significant enough to warrant quantitative drift correction".

Response: The referenced statement was a conclusion drawn from the Study that may be applicable to future studies.

Comment: "The third of the four "issues uncovered" in the Executive Summary and Conclusions is that "Screening pace was faster at Refineries B, C, D, and E, which may have impacted measured screening values (and resulting estimated emissions)." Again, this sounds speculative, and necessitates more explanation.

Screening values can be impacted by screening pace, but emissions (measured by bagging) are not. Pace at the beginning of the Refinery A screening survey was slower than during the screening that was subsequently done immediately prior to bagging, which means that the emissions analysis biases emissions from the initial Refinery A components high (as opposed to biasing emissions from the other components low)."

Response: The Air District does not follow WSPA's rationale. Regression equations used to estimate mass emissions are dependent upon screening values. Lower screening values will result in lower estimated emissions. WSPA's rationale would be relevant if the regression equations were derived from pre-bagging screening values at a given point (e.g., the 8 second measurement) rather than the maximum screening value. The pre-bag screening measurement that was used to derive the regression equations was the maximum screening value that was recorded. There was no time limit imposed by the Air District on the bagging time for these measurements. This can be shown in the amount of time (dwell time) that was spent to reach the maximum pre-bag screening value where this time was as great as 29 minutes.

Comment: "The Executive Summary identifies a "safety stand down" as the reason why the District stopped using its own screening inspectors and using the refineries' instead, which is discussed further with several unsubstantiated statements on page 60 that are not germane to the study. WSPA requests that such statements be removed."

Response: The discussion related to the "safety stand down" is germane as it addresses the question of why the Air District only conducted screening at 1.5 refineries.

Comment: "This statement on page 100 reads as though the District is biasing the results low, and does not appear to be accurate: "Although screening instruments had the capability of and did show concentrations greater than 10,000 ppmv, because instruments were not calibrated with a standard gas above 10,000 ppmv, the maximum screening value shown in results is 10,000 ppmv."

In fact, it appears that all of the actual screening values that exceeded 10,000 ppmv values are shown in Appendix B (none were truncated to 10,000 ppmv), and several tables also show a column for "> 10,000" ppmv."

Response: The report was revised to state "Components with leaks above 10,000 ppmv are listed as '> 10,000 ppmv'."

Comment: "On page 233 there is a statement that "the minimum bag vacuum requirement (0.001 inches H_2O) was met by all samples. However, a pressure gauge with a resolution of 0.005 inches H_2O was used in sampling. It is not clear how lower measurements were identified."

This statement infers that the District may not understand this process. It is important to understand that the gauge was an analog gauge with tic marks every 0.005 inches of water column (which is not the same as "resolution"); when the gauge needle is in between tic marks, the tester visually interpolates, as is typical for analog gauges."

Response: The Air District understood that the gauge was analog and viewed digital photographs of the equipment. Because there were no hash markings indicating increments of 0.001, there would be no reliable way for the tester to "visually interpolate" that a reading was 0.005 versus 0.003 or 0.007 inches of water column.

Comment: "Given that the instruments are not designed for heavy liquids at high temperatures, and because of the deposition problem mentioned in our comments above and the variability in the liquids being monitored, it is not feasible to develop uniform "instrument response times to various materials at different temperatures before study" to "provide to screening personnel for use in screening" as identified in the draft HLS report. Response times will depend on a wide array of variables, including not just material type (which will vary), but also concentration, how long the equipment probe is held at that concentration, etc. This will make it infeasible to simply have an easy "look up table" of precise response times. Instead, it should be recognized that handheld monitors are screening tools, that can be used to distinguish between leaks of different orders of magnitude, but for which there are no "true" values (e.g., to the extent they depend on wind speed at the location of the component) and for which the consistency in readings is going to be limited for a number of reasons beyond the things that can reasonably be controlled."

Response: The Air District agrees with the comment that response times will vary based on a wide array of variables. However, the Air District believes that general response times can be developed as this was done on an ad hoc basis during field screening.

Comment: "The abstract (p. ii) identifies that "the emissions averages resulting from this study are lower than commonly used emission factors developed by the United States Environmental Protection Agency for components in heavy liquid service", with the implication that this was the latest word on the subject. It should also mention the more recent and relevant fact that (1) the 1999 CAPCOA/CARB "California Implementation Guidelines for Estimating Mass Emissions of Fugitive Hydrocarbon Leaks at Petroleum Facilities" (cited by the District's own Permit Handbook) identified that components in heavy liquid service "not [be] included in component counts used for the quantification of fugitive emissions", and that accordingly the District's Permit Handbook doesn't list average emission factors for components in heavy liquid service."

Response: Appendix A of CAPCOA Guidelines addresses "Excluded Components" on page 3 of Appendix A-1:

"Components that are generally excluded from I & M programs monitoring requirements should be reevaluated to determine their true emission potential. Components that have been determined not to leak or emit non-volatile organic compounds (VOC) should be excluded from the inventory. Components that are determined to leak VOCs should be included in the inventory."

The Air District determined that components in heavy liquid service emitted VOCs and are required to be in the emissions inventory.

Previous versions of the Air District's Permit Handbook included the guidance that components in heavy liquid service emitted VOCs and required emissions be estimated and reported for permitted equipment. Emissions from permitted equipment would then be included within the emissions inventory. It appears that when the Handbook was last updated, there was a mistaken assumption that all components, including those in heavy liquid service, were monitored and using correlation equations to estimate emissions. If true, then there would be no need to reference average emission factors for non-monitored components. The Permit Handbook will be revised to correct this error.

Comment: "Page 227 states that "Typically, the valve bonnet flange is considered by the Air District as a connector." For emissions inventories, this would go against both CAPCOA's statewide guidelines and EPA guidelines (which state the opposite) and the corresponding analyses used to generate the emission factors. If the District did not intend this assertion, a more accurate statement would be that "For purposes of the Air District's leak monitoring requirements in Rule 8-18, the bonnet flange is classified as a connector, as currently specified by Section 8-18-204."

Response: This comment does not align with how emissions from valves in LDAR programs are measured, estimated, and reported. For example, LDAR programs have separate entries for both the bonnet flange and the valve stem where both are screened and have separate screening values recorded. Emissions from both are then estimated and provided to the Air District.

Comment: "On page 229, there is a statement that "During the Study, there was a concern that because of the Study design (only two process units were initially selected for screening of connectors and valves), the screening portion may not adequately represent the true distribution of leaks and may exclude potentially significant leaks resulting in lower emissions estimates than actual." Regardless of what was "initially" selected, Table III-63 on page 180 indicates that several process units were sampled from."

Response: Although several process units were sampled, not every process unit or even every process unit type was sampled. Therefore, the referenced text statement still applies.

Comment: "On page 229, there is a statement that "At Refineries B, C, D, and E; separate entries were made for pump seals". That is false, as we have repeatedly identified. Refinery D made separate entries for each pump seal, but refineries B, C, and E made one entry per pump (highest seal) regardless of how many seals were present. We have provided supporting information to the District previously."

Response: The comment would be valid if there were no examples of multiple seal entries recorded for the same pump at these refineries. However, the Air District has provided WSPA examples of separate pump seal entries for Refineries B, C, D, and E.

Rule

Comment: "Given that the emission factors are very small numbers and the number of components is very large, WSPA recommends that some context be provided. For example, applying the emission factors to the listed equipment counts shows that total emissions from the 368,795 valves, pumps, and connectors in heavy liquid service at the refineries is approximately 36 tons per year (TPY). This is obviously substantially lower than the emissions reduction estimate in the District's staff report that was used to justify promulgation of the 2015 Rule 8-18 amendments.

Specifically, the District estimated in the Staff Report that 1,227 TPY of emissions reductions could be obtained from that same equipment by removing the District's exemption of this equipment from leak detection and repair (LDAR) requirements. The data shows that the District's estimate was clearly incorrect."

Response: This comment would be applicable to the Regulation 8, Rule 18 Rule Development efforts and should be made then.

Comment: "As recognized by the draft HLS report, screening value measurements can depend on a number of methodological factors, which include but are not limited to the speed at which the screening monitor is moved, the length of time it is held in one spot, and the proximity of the probe tip to the source. These factors, along with the requisite frequency of calibrations and drift checks, also significantly impact the cost of monitoring that the District is going to be evaluating."

Response: This comment applies to the rule development process and should be discussed then.

Settlement Agreement

Comment: "WSPA and its member companies filed suite (over Rule 8-18 and other related rules), and the ensuing settlement agreements with the District refer to this Heavy Liquid Study. Details in the settlement agreements include the following:

- 'Parties agree that pending completion of the Heavy Liquid Study and the establishment of new emission factors based on the results of the Heavy Liquids Study, the interim Heavy Liquids Emission Factors depicted [below] will be utilized for purposes of complying with and enforcing Rule 12-15, as well as for all other District purposes, including but not limited to, emissions permit fees and rule making.'

  The table of emission factors lists eight component types, and all eight should be identified in the HLS report along with a clear explanation of which are and aren't being covered by the study, given that the HLS is redefining some of the types (e.g., flanges as a subset of connectors), subdividing others (non-process lube oil service vs not), not addressing all of the eight types, and (in the current draft) recommending some but not all of the remaining types for further study. The District also needs to explain what it is proposing to do with regard to emission factors for component types listed in that agreement that are not addressed in the study."

- Following completion of the data collection activities at each refinery, the District was supposed to "meet with the refinery managers and/or other designees of the Petitioners at each refinery participating in the Heavy Liquids Study to discuss the data collection process, any issues encountered, exchange lessons learned and best practices related to data collection from equipment in heavy liquid service, and work to mutually resolve any issues in order to facilitate completion of the Heavy Liquids Study", and the HLS report was supposed to document that.

Particularly, the draft HLS report does not reflect the issues encountered and lessons learned from that field work. This information should be accurately documented in the next revision of the HLS report. WSPA sees the accurate sharing and written documentation of this information to be a key step towards furthering scientific study and minimizing future misunderstandings of technical issues."

Response: Of the referenced eight component types, the report discusses valves, pump seals (other than steam quenched), pump seals (steam-quenched), connectors, flanges (included with connectors), and pressure relief devices. Only the "Others" and "Open Ended Lines" categories are not included within the report.

The referenced table states that the source of information listed within the table is Table IV-3a of the "California Implementation Guidelines for Estimating Mass Emissions of Fugitive Hydrocarbon Leaks at Petroleum Refineries", CAPCOA, February 1999.

Per the 1999 CAPCOA Guidelines, the "Others" category includes "any component type other than connectors, flanges, open-ended lines, pumps, or valves." This included pressure relief valves. However, the referenced table separated pressure relief valves from the "Others" category.

Per the Heavy Liquids Study protocol developed with significant input from WSPA and the five petroleum refineries, the Heavy Liquid Study only included components that were either pump seals, valves, connectors (including flanges), or pressure relief devices.

The report has been revised to recommend that emissions from components other than connectors, pump seals, valves, or pressure relief devices be considered for further emissions study.

Issues encountered during field screening are discussed in Section III.ii.1 Field Observations. Issues encountered during bagging are discussed in Section III.iii.1 Field Observations. Lessons learned are discussed in Section II.i.6. Modifications of the Experimental Design.

Lessons learned toward furthering scientific study are discussed in Section IV.viii. Future Studies.

Study Purpose

Comment: "The purpose of the study is a function of the background. The draft HLS report presents background information in Section I.i, but mischaracterizes the information. For example, the District incorrectly states that District staff used 1980 emission factors as "required" by the CAPCOA Guidelines, and incorrectly identifies the Board's adopting resolution direction regarding the HLS as being "to conduct a joint study with affected refineries to measure mass emissions from components in heavy liquid service and re-visit the cost effectiveness determinations made with the revised rule".

The study's actual background is as follows:

- In 2014, at the time of permit renewal, District staff began requiring that emissions from components in heavy liquid service be based on 1980 average emission factors, in spite of the fact that the 1999 CAPCOA Guidelines stated that such components "are not included in component counts used for the quantification of fugitive emissions" and that the District's own guidance did not (and still does not) say to include components in heavy liquid service.

  This unsupported direction from the District substantially increased emissions inventories at several refineries. District staff required refineries to agree to the change and pay the associated increased permit renewal fees or else risk not having their permits renewed.

- In late 2014 and early 2015, there were multiple meetings between WSPA, its member companies, and District staff regarding this issue. WSPA identified concerns that use of the 1980 factors did not reflect good engineering judgment. On March 9, 2015, District staff acknowledged that in the past, different District refinery permit engineers had not interpreted the methodologies consistently, and identified that the District would prepare a proposal to conduct actual measurements at Bay Area refineries to resolve the disagreement and submit a draft within two weeks.

- District staff subsequently used the 1980 emission factors to justify proposed revisions to Rule 8-18, making these revisions the most significant portion of staff's Refinery Emissions Reduction Strategy.
- On December 15, 2015, the Board promulgated those rule revisions.
- On December 17, 2015, the District e-mailed WSPA the first draft of the 43-page measurement protocol that had been mentioned in the abovementioned meeting on March 9. Clearly, the origin of this protocol predated the Board's adoption of the rule revisions.
  WSPA and its member companies filed suit (over Rule 8-18 and other related rules), and the ensuing settlement agreements with the District refer to this Heavy Liquid Study. Details in the settlement agreements include the following:
- "Parties agree that pending completion of the Heavy Liquid Study and the establishment of new emissions factors based on the results of the Heavy Liquids Study, the interim Heavy Liquids Emissions Factors depicted [below] will be utilized for purposes of complying with and enforcing Rule 12-15, as well as for all other District purposes, including but not limited to, emissions permit fees and rule-making."

Response: The report was revised to include some additional background information.

However, the Air District disagrees with the assertion that including emissions from non-monitored heavy liquid service components in emissions inventories is unsupported.

Appendix A of CAPCOA Guidelines addresses "Excluded Components" on page 3 of Appendix A-1:

"Components that are generally excluded from I & M programs monitoring requirements should be reevaluated to determine their true emission potential. Components that have been determined not to leak or emit non-volatile organic compounds (VOC) should be excluded from the inventory. Components that are determined to leak VOCs should be included in the inventory."

The Air District determined that components in heavy liquid service emitted VOCs and are required to be in the emissions inventory.

Separately, for at least the past 35 years, permit applications submitted by the Bay Area petroleum refineries have included equipment leak emissions estimates from components handling heavy liquid service, when such components were part of a project discussed within the application.

Section 3.4 (Petroleum Refinery Fugitive Emissions) of the Air District's Permit Handbook had the following language from 1991 to 2006:

"Emissions from refinery valves, flanges, pump seals, and compressor seals are calculated by multiplying the number of sources of a particular type by the appropriate emission factor for the fugitive emission source. The choice of emission factor is based the source type (e.g. valve, flange, compressor seal, pump seal), the I/M program in place at the source, and possibly the source fluid. Characterizations of the process fluid as either a light liquid, heavy liquid, or gas stream are based on definitions presented in Environmental Protection Agency document EPA-450/3-80-010.2-22. This document defines gas streams as hydrocarbon gas/vapor at process conditions containing less than 50% hydrogen by volume. Light liquid streams are defined as liquid or liquid/gas streams with a vapor pressure greater than that of kerosene (>0.1 psia @ 100 degrees F or 689 Pa @ 38 degrees C). Heavy liquid streams are defined as liquid streams with a vapor pressure equal to or less than that of kerosene (≤ 0.1 psia @ 100 degrees F or 689 Pa @ 38 degrees C), based on the most volatile class present at greater than 20% by volume." "The emission factors used to calculate refinery fugitive emissions from valves, flanges, compress seals, and pump seals are found in the document titled 'BAAQMD CTG Refinery Emission Factors, 9/8/91'."

In 2006, Section 3.4 of the Permit Handbook was revised to include the following statement:
"Each of the five major refineries (Chevron, ConocoPhillips, Shell, Tesoro, and Valero) in the Bay Area already have District-approved fugitive emission factors derived from the Correlation Equation Method (Method 3) of the Guidelines, based on a comprehensive inspection program of the fugitive components at each of the refineries."

This statement was added as it was believed at the time that the petroleum refineries were including all components handling heavy liquid service streams within their leak inspection programs. This was subsequently found to not be the case.

The Permit Handbook will be revised to address this error.

Background / Previous Studies

Comment: "Pages 7-13: This historical information prior to 1980 seems too outdated to be relevant to this study and is not referenced anywhere else in the Report and should be deleted."

Response: The report has been revised (see III.iv.5.6) to include references to these sections.

Comment: "The background information in Section I.i identifies the District's assertions that (1) with regard to CAPCOA's 1999 exclusion list—i.e., CAPCOA's language was that "the following components are not included in the components counts used for the quantification of fugitive emissions"—the exclusion only pertained to regulatory inspection programs, and that (2) "By default, those components would be required to use [the 1980] average emission factors" (p. 5). The District's assertions here are,

- contrary to the abovementioned language used in the CAPCOA document (as well as the language at the beginning of that section, which states that "In order to accurately calculate fugitive emissions from leaking equipment using the new correlations and emission factors, it is essential that users identify and count components in the same way. This section defines and illustrates how components are to be counted for use with the new emission factors." [emphasis added];"
- not supported by any language in the CAPCOA document; and
- not supported by any language in the relevant section of BAAQMD's own Permit Handbook that cites the CAPCOA document ("Petroleum Refinery Fugitive Emissions/Emission Calculations").

Response: The referenced CAPCOA language contradicts the rationale of the comment. "In order to accurately calculate fugitive emissions … using the new correlation and emission factors …". The correlation equations would not be used where monitoring is not being conducted within an LDAR program. In addition, the CAPCOA guidelines did not develop new emission factors and thus the reference to "...new ... emission factors" refers to the default emission factors that were developed but also apply only to components that are monitored per an LDAR program.

Appendix A of CAPCOA Guidelines addresses "Excluded Components" on page 3 of Appendix A-1:

"Components that are generally excluded from I & M programs monitoring requirements should be reevaluated to determine their true emission potential. Components that have been determined not to leak or emit non-volatile organic compounds (VOC) should be excluded from the inventory. Components that are determined to leak VOCs should be included in the inventory."

The Air District determined that components in heavy liquid service emitted VOCs and are required to be in the emissions inventory.

Previous versions of the Air District's Permit Handbook clearly identified and required estimating emissions from components in heavy liquid service. The Permit Handbook will be revised to correct this omission.

Comment: "In addition, if the District's asserted interpretation were accurate, that would imply that the District would be required to use the 1980 average emission factors for the other 12 types of components in the CAPCOA exclusion list as well, which it does not.:

Response: Emissions would need to be estimated for any components that have been determined to leak emissions. In the absence of other data, emissions would need to be estimated using the listed average emission factors.

Comment: "Section I.i mentions the 1996 study on emissions from components in Heavy Liquid Service but fails to divulge any of the conclusions from that study. It should divulge the emission factors from that study, or at least the fact that the emission factors that were well below the 1980 emission factors."

Response: The 1996 study did not conduct any mass emissions sampling but rather screened components and used the 1993 correlation equations to develop emission factors as stated in Section I.iii.6 of the report. As the emission factors were not derived from mass emissions sampling data, the Air District does not view them as comparable to either the 1980 Study or the Heavy Liquid Study, in which average emission factors were derived using both screening and sampling data.

Comment: "Section I.iii identifies the previous studies, and there are subsequent comparisons with the 1980 study with regard to average emission factors, but there does not seem to be a comparison with regard to all the evaluations the 1980 study made with regard to the effect of temperature, pressure, diameter, etc. It would be particularly useful to both (a) make those comparisons and (b) summarize that information, so that future studies might not have to re-look at "everything under the sun" as potentially impacting the results."

Response: The suggestion for additional evaluations is noted and may be undertaken in future.

Comment: "On page 31, Table II-2, the ownership history of the refineries, has no relevance to the Study and should be removed."

Response: The ownership history provides context to the facilities, may explain any significant differences between facilities, and may be useful for future evaluations (see response above).

Comment: "On page 46 and elsewhere, refinery A is referred to as the "pilot refinery", and there are inferences that procedures were the same throughout the testing of that refinery. In fact, the procedures were changed very early on at that refinery, such that at the end of the testing they were much more similar to those at refineries B-E than at the very beginning. At the time, there was no indication that this refinery was going to be a "pilot", nor are the data being treated any differently (i.e., the District's analysis of average emission factors lumps all the data together), so please remove this term. "First refinery" would be adequate."

Response: The Air District does not understand why the term "pilot" would be pejorative. Rather, the "pilot" refinery was used to identify issues and make changes in methodology (e.g., leak definition, sample size). In addition, the term "pilot" was used by both the Air District and WSPA in the early stages of the Study during pre-screening and post-screening at the refinery.

Editorial

Comment: “Most of the other listings of “Results”, “Issues Uncovered”, and “Recommendations” seem like odd choices for section headers, several of which are not described by the headers they are under. WSPA would be interested in the “improvements…in…screening, and sampling techniques”, but the “improvements” listed in Section IV.viii are not supported and do not reflect the lessons that should have been learned with regard to those techniques (see “Methodology” comments above). Several of the recommendations in that section appear to focus on things that provide more data and reduce some aspect of variability (such as screening distance or response time) without having acknowledged the overarching lessons from this study, such as:

- Clear and unambiguous communications and decision-making are imperative for complex studies involving multiple parties.
- Definitions are important to identify clearly and unambiguously in advance; confusion on this point can get compounded. We have had numerous discussions regarding how to categorize bonnet flanges on valves, what kinds of equipment counts as a PRD for purposes of air emissions, what counts as being “heavy liquid” versus “vapor” service, whether to record one screening value per pump assembly (including connectors), per pump (highest value taken for all seals), or per pump seal, etc., what counts as a “steam-quenched” pump, and what the “non-process lube oil” category that the District exempted from the study explicitly includes.

Page 85 also notes that “Because of the number and diversity of component subtypes, a standardized listing of subtypes was not identified or provided to field personnel and subtype categorizations were left to the field personnel completing the standardized field data sheets.” Lack of consistency in definitions results in lack of consistency in data and analysis. Clear definitions for component types should have been included in the District protocol. And if subtypes are too diverse/numerous/specialized to be consistently categorized, that begs the question of (1) the validity of any analysis based on recorded subtype information and (2) why that information was even recorded.”

Response: The definition of PRV was established prior to the Study and the other cited issues arose during the Study and were not foreseen by any party.

WSPA's suggestion concerning standardizing subtype classifications would not be practical as it requires identifying all component subtypes in use at the five petroleum refineries. It is questionable that any of the five petroleum refineries has an inventory of all the subtypes of components in heavy liquid service at all five refineries.

Regarding the second point, there is value in having field personnel knowledgeable in refinery component types and subtypes record the information to evaluate potential impacts of component subtype classification on emissions.

Comment: “Abstract page ii. The objective identified in the abstract (p. ii), on page 1, and on page 5 are all worded slightly differently, with the first two mentioning an objective to “understand” emissions and the last more specifically stating that the primary objective is to answer the question, “What are the average emission rates for the Bay Area refinery components in heavy liquid service?” The first two explain the recommendations of “improvements…for future studies” including things such as vibration monitoring. However, the Board directive focuses upon specific objectives, and does not mention a need to try to “understand” component fugitives. The statements of objective should be made consistent, and should reflect applicable language in the Board direction and agreements between the District and WSPA as mentioned in our comment letter.”

Response: The text does not state "understand component fugitives" as suggested by the comment. The text states to understand emissions which is a necessary step for developing average emission factors that are necessary to reevaluate cost effectiveness per the Board direction.

Comment: “Abstract pg ii identifies that “measurements were used to develop correlation equations using linear regression analysis”, but as mentioned in our letter, the correlation equations are not identified in the report. If equation [III-2] on page 176 is the correlation equation and the parameters that are in Table III-61 are the parameters for that correlation equation, then they should be identified as such; and if they aren’t, the correlation equations need to be shown.”

Response: The section was revised to state "measurements were used to develop regression equations using linear regression analysis".

Comment: “(Pg xiii) The Glossary should include a definition of “in Heavy Liquid Service” (separate from just “Heavy Liquid”) to document that this means the component is in contact with the heavy liquid itself, not the vapor coming off of it.”

Response: This comment would be applicable to the Regulation 8, Rule 18 Rule Development efforts and should be made then.

Comment: “(Page xiv) The Glossary definition of “Pressure Relief Valve” has two pictures and the bottom one appears to be incorrectly pointing to a bonnet flange as a connector. The report appears to goes back and forth between the terms PRV and PRD interchangeably

– it should be consistent as much as possible, and generically use the more generic term (PRD) to avoid missing any PRDs that are not PRVs.”

Response: In the context of a pressure relief valve, the bonnet flange is a connector.

In the context of the report, a pressure relief valve (PRV) is a device that relieves to atmosphere. A PRV is a type of a pressure relief device (PRD).

Comment: “The Glossary should include a definition of “steam-quenched pump” to avoid confusion. Given that the District was unwilling to base this on observation, we had previously mentioned API Schedules 61 and 62. However, if the District is interested in defining the status pump seals, there are some cases in which there are pumps with two seals where one of the seals appears to be steam-quenched and one does not.”

Response: The Glossary was amended to include an entry for "Steam-Quenched Pump".

Comment: "Page ES-1 of the Executive Summary states that "The Board's adopting resolution directed Air District staff to conduct a joint study with affected refineries to measure mass emissions from components in heavy liquid service", and there is a similar statement on page 4. The adopting resolution does not state that; it only states that
"the Board of Directors directs staff to examine emission reduction and cost effectiveness issues related to the inclusion in Regulation 8, Rule 18 of requirements for monitoring of components in heavy liquid service, and to report back to the Stationary Source Committee prior to July 2017 regarding the results of the examination together with recommendations for modifying the rule if appropriate based on the results."

Response: The Executive Summary was revised to reflect the specific resolution language.

Comment: "The Executive Summary (p. ES-2) shows Table ES-1, "Estimated Population by Component Type".
a. This appears to be the population that was in Heavy Liquid Service and should be labeled as such."

Response: Both Table ES-1 and Table II-3, which was not identified but is identical to Table ES_1, were revised to reflect components in heavy liquid service.

Comment: "This also appears to be the population estimate from 2015. Given the amount of detailed information that the District has received in each refinery's 2016-2020 Rule 12-15 submittals, a more recent estimate should be provided."

Response: The report was revised to include both the original population estimate (since it was the basis for establishing the screening target sample) and the estimated population at the end of the Study.

Comment: "Given the confusion that has been previously discussed it is not clear if the "pump" count is the number of pumps, or the number of pump seals."

Response: The estimate is the number of pumps, not pump seals.

Comment: "For consistency with the rest of the Report, the pressure relief device (PRD) count should exclude the count of PRDs that are in vapor service (where the vapor is coming off heavy liquids). Information in the report indicates that 30 PRDs were screened and it is not clear if that number reflects PRDs that are actually in heavy liquid service."

Response: The cited counts include all components that were included in the Study that handled material with an initial boiling point greater than 302 degrees Fahrenheit. The 30 PRDs were identified and verified by refinery personnel as being in heavy liquid service and not in vapor service.

Comment: "The Executive Summary (p. ES-3) mentions that "Process units were first selected using process flow diagrams provided by each petroleum refinery. After selecting process units, individual process lines were identified from petroleum refinery-provided piping and instrumentation diagrams." It should clarify that the District selected both the process units and the process lines."

Response: The referenced section and text was revised to include "by the Air District" to provide the requested clarification.

Comment: "On page ES-5 (and page 244), the section titled "Recommendations" states that "There were several component types for which average emission rates could not be derived either because there were insufficient numbers, their emissions could not be evaluated, or they are recommended for inclusion in a future study" – pressure relief valves that relieve to atmosphere, pump seals with steam or hot oil quenching systems, and components handling non-process lube oil. It should be clarified which ones are which: e.g., that the PRVs had insufficient numbers, the steam-quenched pumps could not be evaluated, and the lube oils were recommended for inclusion in a future study. For steam-quenched pumps, it should be acknowledged that WSPA did propose to get the best information possible with available monitoring equipment; however, the District identified that they did not agree with this, and also declined to specify what they would recommend."

Response: The report was revised to clarify the distinction between component types as suggested.

Comment: "With regard to the "future study" of components handling "non-process lube oil", the Report should recognize that WSPA developed the protocol, the District approved it, and the emissions data were provided to and quality-assured by the District in 2019. In addition, definitions continue to be important: "non-process lube oil" is shorthand for "low-volatility finished products", which were explicitly defined as

"finished products having an initial boiling point greater than 302° F that are being used for their intended purpose including, but not limited to, hydraulic fluids, glycol in transmitter loops, seal fluid, MEA, DEA, and lubrication oil used to lubricate, including but not limited to pumps, compressors and other rotating equipment"
or
"finished lubricants and base oils that require no further processing, other than blending, to produce finished lubricant products, and are at an operating temperature of less than 200° F".

To prevent confusion, this explicit definition should be included in the HLS Report (i.e., the Glossary)."

Response: The Glossary was amended to include an entry for "Non-Process Lube Oil".

Comment: "Section II.ii. is titled "Sampling Methodology" but describes both screening and sampling and should be titled accordingly."

Response: "Sampling" included both screening and mass emissions sampling and does not refer to only mass emissions measurements.

Comment: “Page 85 contains the text that “Component subtype categories were identified for connectors, valves, and pressure relief devices. Because of the number and diversity of component subtypes, a standardized listing of subtypes was not identified or provided to field personnel and subtype categorizations were left to the field personnel completing the standardized field data sheets. Proper identification and categorization of a component subtype depended upon the familiarity and knowledge of field personnel.” Since “proper” identification and categorization is not standardized and is acknowledged as having not been identified, the last sentence should be removed. This is also pertinent to the subsequent analysis of information by subtype; the subsequent tables and figures should be footnoted accordingly.”

Response: The Air District agrees with the comment regarding the word "proper" and this word was deleted from the last sentence in the revised report.

Comment: “Page 150 shows how TO-15 results were biased low compared to tube results, and states that “The difference between two figures for the same component is attributed to the difference in sample volumes for the canisters as compared to the sorbent tubes.” This statement appears to be flawed. What it should instead identify is that (1) there was a knockout upstream of the canisters and (2) the TO-method is more suited to more volatile components, as less volatile components may stay adsorbed on the canister walls.”

Response: The referenced language was not intended to address the difference between results between the two sampling media but rather to explain the difference between the concentration and mass emissions for the same compound. For example, Figure III.36 shows that the canister (TO-15) measured a higher concentration of C8 compounds than the other samples; however, in Figure III.37, mass emissions of C8 compounds from the other samples are greater than the canister sample. This discrepancy is explained by the fact that although the other samples measured less concentrations of C8 compounds, their sample volumes were greater, so their corresponding mass emissions were also greater.

However, to prevent confusion, the refenced text was deleted.

Comment: “There does not seem to be any discussion of the graphs on and around page 156, and the casual reader might erroneously infer that (for example) hydrotreaters have more leakers, etc. In fact, what seems more appropriate to conclude—given this study and previous ones—is that (a) there are very few leakers and (b) their location cannot be predicted a priori.”

Response: Language was added after Figure III.44 to address sampled emissions from hydrotreaters.

Comment: “Page 179 states that “The five petroleum refineries have agreed to incorporate any components handling a heavy liquid stream in the gaseous phase within their LDAR programs. As such, it will be necessary to have separate average emission factors with and without gaseous phase components.” If the components are subject to LDAR, there is no need to have an average emission factor that includes both them and components that are not subject to LDAR. More appropriate language addressing this issue is on page 229 and the language on page 179 should be corrected.”

Response: This section was revised to address the comment.

Comment: "Page 196 incorrectly identifies that the scenarios exclude gaseous phase components and components handling non-process lube oil; as identified by our other comments, they appear to actually include both the components in gaseous phase (which has a significant impact on the results, given the high screening values for several components handling gaseous phase material) and components in "non-process lube oil" service (though these are all very low emitters)."

Response: The screening data set included within the appendix includes all components that were screened including those in gaseous phase and non-process lube oil. However, the gaseous phase components were excluded from the derivation of the emission factors.

Comment: "On Page 212, the quotient (primary results – replicate results / average of the two) is not "absolute" difference but the "relative" difference. And the problem with using only this as a metric is that two results that are wildly different—e.g., by an order of magnitude, two orders of magnitude, or three orders of magnitude—will have very similar quotients (close to 200%, because the denominator will be approximately equal to half of the higher value)."

Response: The report was revised to state "relative" rather than "absolute" difference.

Comment: "On page 232, Table IV-1 is titled "Comparison of Number of Components Screened and Sampled Between 1980 Study and Heavy Liquids Study", but this is inaccurate; i.e., for the 1980 study, this is only the number of components in heavy liquid service that were screened and sampled. The table also mentioned that "The specific number of flanges in heavy liquid service that were screened is not known", but this information appears to be available in Table B2-21 on page 230 of the 1980 EPA study."

Response: The footnotes to Table IV-1 were revised to clarify the cited 1980 Study numbers include only those components in heavy liquid service (what is relevant for the comparison).

Regarding flanges screened in the 1980 Study, there appears to be a discrepancy in Table B2-21 when summing up the number of flanges by variable (none of the sums equal each other). It is not clear from the table whether it reflects all flanges in heavy liquid service that were screened or only a subset for which process variables were recorded. When totaling the cited numbers of flanges by process variable (e.g., gasket material, vibration, manufacturer code), none of the totals match each other.

For example, the total number of flanges by "Manufacturer Code" totals 209 flanges. The total number of flanges by "Gasket Material" is 254 while the total by "Vibration" is 307.

The text in Section 2.5.3 preceding Table B2-21 states "Note that the sum of the sources listed for each variable is not the same for all variable groups due to missing data for some sources."

This suggests that Table B2-21 reflects a subset of flanges that were screened.

Comment: “Pages 221-222 attempt to define the terms screening time and screening pace, but are still ambiguous. The sentence “Screening time is not expected to impact the actual leak concentration but rather what is measured” is unclear, given that there is no “actual” leak concentration – that is purely a function of how the measurement is taken. The Report needs to clarify that in the relatively simple case of something like a flange, the total time needed to screen it is going to be the sum of (1) the time needed to move the probe all the way around the flange (which is in turn a function of the diameter of the flange lip, not the line size) and what would often be referred to as the “pace” (speed of movement around the flange), as well as any obstructions that might require the screener to have to move to a different spot to screen and any other potential interferences; and (2) any additional time needed as a result of finding an elevated concentration: i.e., time needed to locate the point of maximum concentration, and hold it at that point. Our understanding—though it is not clarified in the report—is that this “total time” is the difference between the beginning and end times recorded by the screeners for each component. Accordingly, if “pace” as calculated in the Report is that total time by an estimated circumference (i.e., not the same as “pace” as defined above), the “pace” itself is a function of the extent to which a leak was found, and the graphs that seem to imply the difference that the pace makes on the emissions/screening value (p. 144) need to also have some discussion identifying that the emissions/screening value also affects the “pace”.”

Response: The Air District agrees with the statement that the measured leak concentration is a function of how the measurement is taken. However, there is an "actual" leak concentration that is attempted to be measured by the screening device. The intent of following established screening protocols (EPA Method 21, etc.) is to reduce the variation between the measured leak concentration and the actual leak concentration.

Regarding "pace", it is correct that the total time includes both the time to identify the location of maximum leakage as well as the time spent measuring the leak at that location. Additional language was included in Section III.i.5 under "Component Monitoring Time / Pace" around Equation III-1 to make this clear.

Component Classification / Scope

Comment: "Another key aspect of the study was that components in gas-phase service were supposed to excluded. The whole purpose of that agreement was technical in nature, pointing out that a vapor leak is very different from a liquid leak and can potentially have a nearly unlimited flowrate whereas a nondripping leak from a component in liquid service is limited by the rate at which the liquid volatizes."

Response: The Air District disagrees with the stated reason for excluding these components.

These components were excluded because they would be included within each refinery's leak detection and repair program for which average emission factors for non-monitored components would not apply. These components were excluded from the data sets used to derive the average emission factors. However, these components were left in the field screening data set that was included in an attachment to the report for an accurate accounting of what was found during the Study.

Comment: "Accordingly, the understanding was that the District would exclude components in vapor service from the analysis of components in heavy liquid service if the refineries agreed to classify these as components in "vapor" service (and included in their existing LDAR programs), and that is reflected in the draft HLS report text. However, it is not clear that the District has actually excluded those points from the analysis: i.e., both the data table in Appendix B-1 and several of the data summaries appear to include these components—two of which had screening values of over 10,000 ppm and two of which had screening values of 2,263 ppm and 1,749 ppm22--while others (such as Table III-64) seem to have excluded them."

Response: The referenced screening data was excluded from the analysis for deriving the average emission rates but was not excluded from the data set included in the appendix. This was done for an accurate reflection of what was found during screening.

Comment: "Page 227 states that "if a sample only included a bonnet flange and did not include the valve stem, this sample was considered a connector as the valve stem is considered the defining feature of a valve and the location where leaks most often occur". This was never discussed with WSPA, and we were not made aware if this situation ever occurred. A bonnet flange is a flange that is part of a valve, the CAPCOA Guidelines and this study clearly identify that "valve" includes both the stem and any bonnet flanges on the valve. If the District reclassified a valve's bonnet flange as a connector, that would be contrary to the what was agreed upon and this needs to be changed."

Response: This was discussed in Technical Working Group calls (for example, see notes/emails for meeting on 11/07/2019) and included in the "Data Entry / Analysis Comments" column of the "Heavy Liquids Study_Bag Data Analysis_2020-02-07_Technical Working Group-Revised_2020-06-15" sent to the Technical Working Group on June 15, 2020. However, there was no impact of re-classifying the few such components within the bagged data since the bagged data set for valves and connectors was ultimately pooled to derive the same regression equations for both valves and connectors.

Screening

Comment: " The District's initial screening was problematic, with very slow movement and hold times, multiple monitor breakdowns (list prices for new monitors can be in the neighborhood of $10K-$20K),15 monitors sometimes taking hours to return to background levels after monitoring (not just the much shorter times shown in Table II-12 of the draft HLS report), and some very large discrepancies between readings taken by different people monitoring the same component. The District subsequently modified its methodology over the course of the study to at least partially mitigate those problems – including changes in monitoring speeds and automatically swapping out monitors if elevated concentrations were found (another added cost)—but these changes and their timing are not divulged (and in some cases are inaccurately stated) in the draft HLS report. The HLS report needs to divulge the details of these issues, both for purposes of cost implications and improving future studies."

Response: Changes in the methodology employed are discussed in Section II.i.6 (Modifications of the Experimental Design) and in Section II.ii.3 (Modifications of the Experimental Design). The comment regarding cost implications would apply to the rule development process and should be made then.

Comment: "The draft HLS report also omits mention of a key concept associated with the screening methodology that explains several of the findings in this study and therefore is important to include in the revised report, both for purposes of analyzing the results of this study and planning future ones. While the report recognizes the problems associated with steam condensing in the monitors (for steam-quenched pump seals), it fails to point out the much more widespread issue that heavy hydrocarbon liquids at high temperatures are prone to condensing in screening monitors and their probes.

This is the reason for the slow response times and "clear times" noted on pages 49-50, 67-71, 99, and 220, and may also contribute to the apparent "drift" issues mentioned on pages 68-69 and 222 (which can result from calibration gas getting adsorbed by heavy liquids that are adsorbed on the probe wall and/or recalibrating instruments with zero gas when they still have some residual adsorbed hydrocarbon, rather than true "drift"). This deposition is also why monitors needed to be swapped out after readings higher than specified values (something that should be mentioned in the draft HLS report): i.e., people sometimes had to flush the monitor for hours to clear out the deposited material. On the other hand, if there is insufficient cooling in the probe, hot material can reach the detector and damage the monitor, which only has an operating range of -10 to 45 °C (14-113 °F).19 These problems were exacerbated by the study's specification to always hold the monitor's probe tip closer to components than required by Method 21 (exposing it to the hottest temperatures) and hold it in place for an extended period of time, and that should be recognized in the report."

Response: The occurrence or impact of hydrocarbons condensing within and affecting screening instruments was not evaluated as part of the Heavy Liquids Study. However, this possibility was included within the revised report in Section IV (Discussion). ii (Screening) as well as in Section IV.viii. (Future Studies).

Method 21 requires screening at the interface of components where leakage occurs. Where a pumps or compressor shaft is rotating, Method 21 allows that the screening instrument probe inlet may be positioned up to 1 centimeter away from the interface. As such, the comment suggests that Method 21 screening may not be performed with the TVA 2020 (the screening instruments used in the Heavy Liquid Study) for any components handling materials with a temperature above 113 degrees Fahrenheit (the listed operating range).

It is the Air District's understanding that several of the petroleum refineries use either the TVA 2020 or its predecessor, the TVA 1000B, within Method 21 inspections of components handling materials with operating temperatures well above 113 degrees Fahrenheit.

Comment: "Section II.i.6 should include the information in the March 8, 2018 and March 16, 2018 e-mails from staff (i.e., Linda Duca/BAAQMD), which were helpful to field personnel and provided useful clarifications. It should also clarify that sampling was called off when it was raining. WSPA can provide copies of these emails if the District does not have them."

Response: Section II.i.6 addresses changes to the design of the study. However, the referenced e-mails address changes to the screening/sampling methodology discussed in Section II.ii.3. This section of the report was revised to include additional clarifications.

Comment: "Page 50 shows an IR temperature gun being aimed inside a flange between the gasket and the flange face. There are several issues with this:

a. This specific direction of where to aim the gun on a flange was not specified in the protocols that were in place at the time that the District inspectors did their work, or in the 2018 protocol that was in place at the time that the refineries/contractors did their work, nor did WSPA observe it in the field
b. It is unclear how a person would be able to point the laser at such a spot, given that the flange ends are bolted together tightly over the flange (see, for example, Figure II.1 on p. 34).
c. It should be recognized that the laser spot is an approximation of where the temperature is being measured from; it is not exact (i.e., the temperature is not being read from the exact spot where the beam hits)."

Response: The Air District provided this guidance in training to both Air District inspectors who participated in screening as well as to the third-party auditors overseeing screening by refinery personnel. As can be seen in digital photographs of flanges, some bolted flanges can have gaps of several inches. Therefore, it is possible to obtain temperatures as shown in the figure.

The Air District recognizes that temperature measurements were estimates. As with all measuring instruments, there are uncertainties with the measurement attributed to both the instrument itself as well as with how the instrument is employed.

Comment: "The precise changes in screening time that were made are not documented in the draft HLS report and need to be. Other changes that were made in the study over time included changing the leak threshold of 2.5 ppm (identified on p. 51) and swapping out monitors whenever a concentration over a specified value was detected."

Response: There were several changes implemented to improve the efficiency of screening components.

These included:
- increasing the threshold for the documentation of leaking components (from 2.5 ppmv to 25 ppmv), which reduced the amount of time in between screening of components.
- revising practice of swapping screening instruments every 25 components (to reduce potential of failing a drift criteria), and
- revising the practice of conducting a drift test of a screening instrument after measuring a leak of 25 ppmv or greater (to reduce potential of failing a drift criteria).

These changes are documented within the report. However, the minimum screening pace requirements or direction was not changed.

In a March 8, 2016 email (referenced in WSPA Comment # 19) from staff to WSPA, staff stated "Monitoring Pace: Continue to work to ensure that monitoring pace is slow enough to spend at least 1/4" per second of circumference of the component when the monitoring for leaks, and as long as necessary to reach the maximum ppm value leak (1 minute plateau guideline)."

Comment: "On page 68, a key monitor specification that is not identified is operating temperature range. This should be identified; the TVA has an operating range of -10 to 45 °C (14-113 °F)."

Response: This was not discussed prior to initiating the Study and was not included within the Protocol that was extensively discussed with WSPA. Checks were not done in the field to verify that the instruments were used within this range. As such, it was not included in Table II-9 of the report.

Comment: "Page 220 defines screening instrument "response" as "the difference between the measured concentration and the actual concentration of a leak", but there is no "actual concentration of a leak". The actual concentrations in the vicinity of the leak vary spatially and temporally and depend on many factors, including the size of the wetted surface exposed to the air, airflows around that wetted area (including those due to wind and those due to a monitor's sampling pump), temperature (at the liquid-air interface), and the equilibrium vapor pressures and vaporization rates of the various components of the liquid as a function of temperature. What is going to be recorded by the instrument is going to be a function of those actual concentrations, the sampling pump flowrate, the location and orientation of the probe tip (and the extent to which that location and the pump speed influence the actual concentrations), instrument response time and response factor (both of which can also depend on the substances in the liquid being monitored), the extent to which you have a steady-state situation between the volatization rate from the leak point and the flow going into the probe tip, the extent to which you are outside the monitor's temperature range, and the extent to you lose material due to deposition in the probe and instrument or gain it due to the revolatization of material that was previously adsorbed on to the probe wall/instrument surfaces (both of which are affected by temperature, equilibrium vapor pressures, and volatization rates)."

Response: The entire sentence in the draft report should be cited: "Screening instrument response (the difference between the measured concentration and the actual concentration of a leak) was found to vary depending upon the stream material, the leak magnitude, and the temperature of the stream material."

Most of the variables identified in the comment (pump flow rate, probe orientation, probe location) were stipulated within the procedures to follow by screening personnel. Assuming these procedures were followed, the stated language in the report still applies.

Comment: "On page 230, there is mention of use of a FLIR camera that was terminated "when the petroleum refinery personnel determined more process lines than expected would be affected and it became a daunting task" that is then followed up with an alternative explanation that "this effort ceased once several components with leaks were discovered with screening values above 10,000 ppmv were identified". The latter is an unsubstantiated statement that appears to be a gross mischaracterization of the fact that FLIR camera readings are often interfered with by heat. In addition, FLIR cameras do not measure either concentrations or screening values. Accordingly, this statement should be removed."

Response: The comment conflates two statements within the draft report.

The cited language is from the following paragraph:

"Believing that the likelihood of such leaks was limited to a few process lines, one petroleum refinery manager offered to use their subject matter experts to identify process lines within their petroleum refinery through knowledge of their operating conditions and physical chemistry calculations. However, this effort was halted when the petroleum refinery personnel determined more process lines than expected would be affected and it became a daunting task."

It is clear from the context of the paragraph that the cited text applies to the effort to identify process lines through knowledge of operating conditions and physical chemistry calculations.

Regarding the use of a FLIR camera, the report states that "there were several concerns with this approach:

- the operator skill needed to correctly position the camera at each leak point for a valid reading,
- potential interference or masking of leaks by steam, clouds of which are ubiquitous within each petroleum refinery, and
- the high threshold for identifying leaks, potentially missing moderate to significant leaks."

However, the use of a FLIR camera for identifying large leaks (> 10,000 ppmv) is common practice by the petroleum refineries as well as cited in published documents by the CARB and the EPA.

See Section 2.1 (page 2-2) of California Air Resources Board "Air Resources Board IFB No. 13-414: Enhanced Inspection & Maintenance for GHG & VOCs at Upstream Facilities – (Revised)", dated November 2019:

"A FLIR GF-320 infrared (IR) camera was also used to survey all equipment for large leaks (i.e. leaks > 10,000 ppm)."

https://ww2.arb.ca.gov/sites/default/files/2020-04/2019-11-21%20CARB%2013-414%20Revised%20Final%20Report_0.pdf

Comment: “Page 200 shows drift check results for calibration gases. However, what would be particularly interesting to know would be (1) what the drift results for the zero gases were (obviously, those can’t be expressed as %) and (2) what sequence the drift checks were done in (e.g., was 10 ppm always first). This might potentially shed more light on results.”

Response: The sequence of calibration drift checks was expected to be in sequential order (zero gas, 10 ppmv, etc.). However, the field data sheets did not capture this information so it would not be possible to verify whether all calibration drift checks were indeed done sequentially.

Comment: “The discussion of the justification of the screening methodology on page 220 of the draft HLS report appears to be most focused on obtaining the highest screening value possible, rather than recognizing that these are truly screening instruments – especially in heavy liquids application – where it may be better to do a larger number of screenings quickly than do a smaller number slowly. The report should recognize and acknowledge that for purposes of emissions, what is most important is that the screening methodology used to screen components and the screening methodology used prior to bagging (that is used to relate screening values to emissions rates) are consistent.”

Response: The Study required that both screening and bagging utilize the same screening methodology, which included identifying the maximum screening value. The comment suggests that rather than identifying the "highest screening value possible", it would be preferable that screening be conducted within the same screening duration (faster than the time required to identify the maximum screening value). However, TRICORD's (WSPA bagging contractor) data showed the fallacy in this.

For each bagged sample taken at Refineries B, C, D, and E; TRICORD recorded two pre-bag screening results: one after eight seconds and the maximum screening value identified, regardless of time duration, as well as the total time spent to reach this maximum value. Several of these components had the same 8-second pre-bag screening result but had different final pre-bag screening values.

For example, bagged samples D019, D025, and E016 all had 8-second pre-bag screening values of 58 ppmv. However, they had final pre-bag screening values of 76 ppmv, 63 ppmv, and 967 ppmv, respectively. The measured mass emissions of E016 was one and two orders greater than that measured with samples D019 and D025.

In this case, if only samples D019 and D025 were bagged and E016 only screened, mass emissions from E016 would be underestimated by one or two orders of magnitude following the comment's suggestion.

Sampling

Comment: "In several parts of the Report it is mentioned that "Method 18" was used—including for the evacuated canisters, for which it does not apply—and US EPA Method 18 is included in an appendix; page 62 states that samples were analyzed "following the procedures specified in Section 8.2.4 (Adsorption Tube Procedure)". There is actually very little analytical detail in that Section (or in Method 18 as a whole), and typically not all of the procedures are followed. Among analytical laboratories, the term "Method 18" is often used colloquially to refer to GC work in general. Details of the actual analytical work conducted were provided to and reviewed by the District's source test division. At a minimum, Method 18 should be removed from the appendix, and canister analysis should only reference the relevant "TO" method."

Response: Method 18 is listed on the cover sheets of laboratory reports from Enthalpy Analytical for samples taken by TRICORD (WSPA's consultant) as well as by the Air District. For sampling done with evacuated cannisters, Method 18 was used for any liquid condensate collected in prior to the cannister. The report was revised to clarify this distinction.

Comment: "Page 72 states that "A Thermo Fisher Scientific TVA1000B was used at the pilot refinery (Refinery A) while a Thermo Fisher Scientific TVA2020 was used at the other refineries." That statement is not accurate – i.e., TVA2020's were used at Refinery A as well (as the District specified in their protocol) - but we are not completely sure whether they were used 100% of the time. This can be confirmed from the District's field sheets, which identified all the TVA #'s used."

Response: The referenced sentence applies to the pre-bag screening that was conducted by TRICORD at Refinery A. See July 07, 2017 email from David Ranum of TRICOD to Kevin Buchan of WSPA, in which TRICORD agreed to use TVA 2020 after Refinery A.

Comment: "There is no indication that the "sample train recovery tests" mentioned on page 74 were done – e.g., no data is provided – and this sentence is unclear: "The theoretical amount of methane introduced into the system was calculated using the measured concentrations (introduced and bag measured) and gas flow rates and compared to the amount calculated as collected in the bag, correcting for pressure and temperature." If they were done, please clarify (i.e., how is gas flow rate pertinent) and if they were not done, please remove reference to them."

Response: These tests were conducted by WSPA's bagging contractor, TRICORD and calculated using gas flow rate. These recoveries were provided to the Air District by WSPA and TRICORD. The report and Appendix C-2 were revised to include the results of these tests (see new Table C-2-6).

Comment: "Page 77 states that 'a select few [samples] were taken with a XAD tube in series with the charcoal tubes with the XAD tube closest to the component leak'. To be clear, all of the initial samples were taken with XAD tubes to comply with the District's original protocol. The test protocol was subsequently revised when it was realized that these tubes (a) were not necessary and (b) created excessive pressure drop. District source test personnel had a good explanation for why the XAD was originally specified, and why they were subsequently dropped and this information should be included in the writeup. Similarly, page 79 indicates that lab results went to only C24, but C30 for condensate; the original version of the District's protocol mentioned taking all analysis out to C30, but this was subsequently scaled back when it was recognized that this was not necessary."

Response: This is discussed in section II.ii.3 "Modification of the Experimental Design" under Sampling Media and Analysis.

In a July 07, 2017 email from David Ranum of TRICOD to Kevin Buchan of WSPA regarding changes made after Refinery A, TRICORD stated "XAD Tubes - TRICORD understands that the District may request XAD tubes be used on certain high temperature components. Provided the District gives 24-hour notice, TRICORD will be able to arrange the sample collection using the same setup used at [Refinery A] - i.e. 3 series connected tubes consisting of a XAD tube, followed by two charcoal tubes."

Therefore, the use of a XAD tube was not summarily "dropped".

Comment: "On page 226, when providing details regarding sample C004, please add that the vapor was obviously not from a heavy liquid – i.e., this was the sole component for which the overwhelming majority of the sample was C5."

Response: The Air District confirmed the sample was from a component in heavy liquid service and cannot provide more information without possibly divulging confidential business information.

Correlation Equations

Comment: "Correlation equations are needed to estimate the mass emissions rates that correspond to each of the measured screening values which are then combined to determine average emissions rates. The need for correlation equations was mentioned extensively by the District between 2016-2020, and while the abstract to the draft HLS report refers to correlation equations, those equations are not identified in the report."

Comment: "As shown previously by EPA, WSPA, and CARB, the first step towards developing correlation equations is to do linear regression in log-log space, which the District did. The District added an additional term for temperature because there was a statistically significant dependence and including that term reduced residuals. WSPA understands why this was a first step, but repeatedly asked the District to reconsider or refine that inclusion. There are several reasons that WSPA is still asking for the inclusion of correlation equations:"

Response: The intent of the Heavy Liquids Study was to estimate average emissions, not to develop correlation equations. As stated in Appendix D-1, the transformation scale bias correction factor approach was not appropriate for and not used within the Heavy Liquid Study. As such, the transformation scale error could not be readily accounted for and combined with the regression equations to develop the requested correlation equations.

Temperature

Multiple comments were made regarding the inclusion of a temperature variable within the regression equations used to estimate emissions from screened components.

Comment: "While the portion of the equation that includes temperature is a simple line in log-log space, when the equation for emissions (as opposed to the log of emissions) is written, temperature is an exponent, and that form of the emissions equation shows an unrealistic dependence on temperature that is not sufficiently supported by the data or scientific principles."

Response: It is unclear which principles should be involved – whether the relationship of leakage to temperature is linear or exponential. The Study goal was to provide good estimates of emissions. This involved finding its relationship with other variables that are best supported by the data.

Taking the logarithm of temperature – lt = $\log_{10}$(temperature) – was considered rather than t = temperature but this was rejected because temperature provided a better fit.

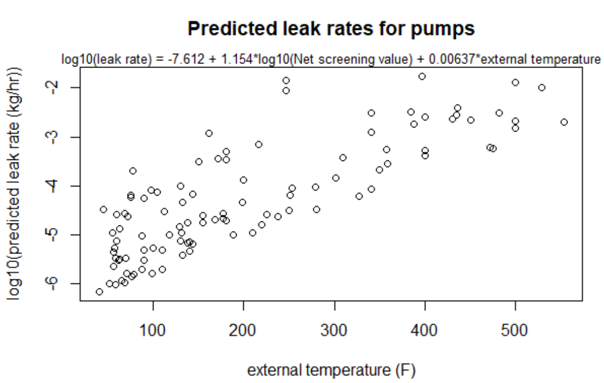
A test of this is to put both lt and t into the same model. Of course, these are highly colinear. In the pump seals regression equation, neither is statistically significant – that is the inclusion of either after the other in the model does not improve the fit. But for the valve and connector regression, the inclusion of t after lt is statistically significant whereas the inclusion of lt after t is not. Thus, t provides a better fit, so it is used.

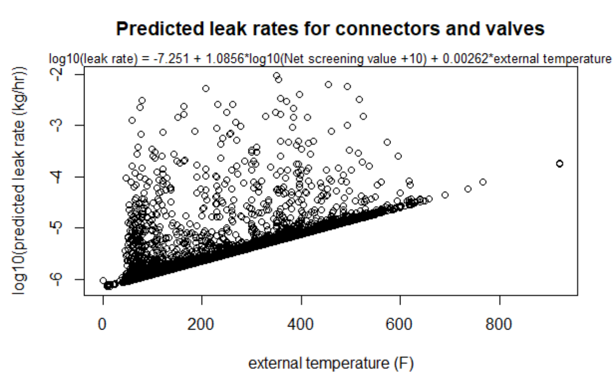
Comment: "The component temperature data themselves are not very high quality."

Response: The comment is a subjective judgement. The value of a variable here is if it can add precision to the estimate of emissions leakage. The temperature term is highly statistically significant and does appreciably improve the fit as will be demonstrated below.

Comment: "An exponential form yields vastly larger factors at high temperatures."

Response: Although there is validity to the comment, it is counterbalanced by the very low leakage rates predicted by the other factors. As shown in the following figures, high temperatures do not produce leakage estimate outliers.





Comment: "There was no guidance regarding the specifics of temperature monitoring in the protocols provided to the screeners, baggers, and 3rd party observers,20 and the District appears to have filled in missing component temperature data by simply setting them equal to "operating temperature" data (even though there is considerable scatter in the correlation between those temperatures, and Figure III.i.2.6 of Appendix D.1 illustrates a difference between "operating temperature" and component temperature)."

Response: Direction was given in training provided by the Air District's field team to the refinery screening personnel and was included within training materials.

Comment: "The addition of the temperature dependence adds complexity and makes the equation less useful for purposes outside of this study (i.e., it could only be used to calculate mass emissions if screeners also had the time to collect temperature data)."

Response: The Air District cannot speak to "purposes outside of the study", only to those of the Study, which were to evaluate emissions from heavy liquid service components.

Comment: "The temperature correlations appear weak (as shown in Figure III.i.2.6 of Appendix D.1 below) – in particular, too weak to support the current form of the equation over other forms for temperature that might make more sense (e.g., ones where the effect of temperature changes with screening value) – and it does not appear that they appreciably improve the results."

Response: The comment "appreciably improve" is subjective. The inclusion of the temperature term in the valve and connector regression equation improves the adjusted R^2 from 74.0% to 84.2%, and in the pump seal regression equation from 64.5% to 72.8%. The p-values for the temperature coefficients were < 0.0001 and 0.003 respectively.

In this case, the important issue is how well the component leakage can be estimated by the regression equation, which is governed by the regression sigma.

For valves and connectors, the sigma dropped from 0.5348 to 0.4173. Even this modest reduction will make a big difference on the original scale, where the estimates are $\hat{Y}_i = 10^{p_i + \sigma Z_i}$, where Z_i is a standard normal variable, here assuming pi and σ are known, for simplicity.

Although the confidence intervals in the analysis were based on simulations, they will act similarly to one based on the Central Limit Theorem (CLT), namely that the estimate

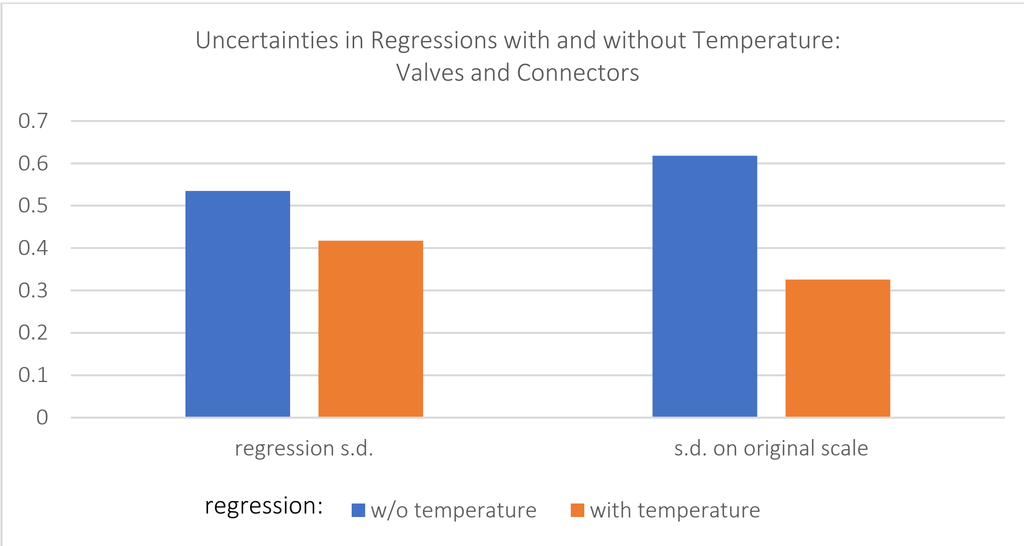
$L = \sum_{i=1}^{n} 10^{p_i + \sigma Z_i}$ is approximately normal with variance

$Var(L) = \sum_{i=1}^{n} Var(10^{p_i + \sigma Z_i}) = \sum_{i=1}^{n} 10^{2p_i} Var(10^{\sigma Z_i}) = Var(10^{\sigma Z}) \sum_{i=1}^{n} 10^{2p_i}$. considering the p_i and σ constant.

The upper bound of the confidence interval will be proportional to the square root of $Var(10^{\sigma Z})$. $10^{\sigma Z}$ has a lognormal distribution with scale parameter μ = 0 and shape parameter ln(10)σ. Therefore, its variance is:

$\tau^2 = e^{2\ln(10)^2\sigma^2} - e^{\ln(10)^2\sigma^2}$.

Applying this to the estimated standard errors, τ = 0.62 for a standard error of 0.5348 and τ = 0.33 for a standard error of 0.4173. So, the CLT approximated confidence interval would be almost twice as wide with the former s.e. as the latter (see figure).



For pump seals, the difference in standard errors is more modest, 0.7264 for the model without temperature vs. 0.6345 for the model with. The corresponding τ's are τ = 1.57 and τ = 1.01, so even here the confidence intervals for a regression without temperature would be more than 50% larger (see figure).

The goal of the analysis was to provide leakage estimates that were as precise as possible. The reduction in confidence interval widths of more than a third to almost in half is an appreciable improvement in our opinion.

Comment: “On page 145, there should be some discussion regarding the fact that the act of bagging itself can increase the temperature around the component (compared to when it is open to air; i.e., heat trapping) and cause more emissions than would have otherwise been present, as illustrated by the photos and associated text that WSPA’s consultant provided to the District in the past. This also seems to be born out by the results for A09 mentioned on page 212, where a component that was bagged for an extended period of time showed two orders of magnitude more emissions from the bag at the end of the time period than at the beginning of the time period.”

Response: The report currently states that the act of bagging may affect emissions (see page 225). The Study did not evaluate whether bagging would lead to a temperature rise, the degree of temperature rise, and what impact that may have on emissions. Regarding Sample A09, a plausible reason for the difference in measurements could be a change in the process or operation.

Statistical Approach

Comment: "The second step towards developing correlation equations – in previous studies by EPA, WSPA, and CARB – was then to adjust the linear regression lines for the scale transformation. The District opted to not adjust for scale transformation explicitly—in part because of a claim that a certain distribution was necessary, and use a bootstrapping approach instead. WSPA finds the writeup in Appendix D.1 confusing and the draft HLS does not clearly identify,

- Which of the eight scenarios shown in Tables IV-4 and IV-5 was eventually used to determine average emissions (page D-1-27 identifies which ones had "the highest adjusted R2 and lowest sigma", but does not specify that these were the scenarios used, and none of the parameters match those shown in Table III-62 on page 177); or
- Any quantitative intermediate calculations/sample calculations showing how the District arrived at the emission factors using the regression equations."

Response: Scenario 6 was used, and the report was revised so that regression parameters shown in Table III-62 match those shown in Appendix D-1. Appendix D-1 has been revised to include more discussion and figures surrounding the approach used.

Comment: "Because there are several calculations being made, a key check that was explicitly discussed and agreed to by the District in 2018, was to make sure than when each correlation equation was applied to the corresponding screening values measured prior to bagging, it agreed reasonably well with the actual measured emissions rates for those bags. (It could also be compared to other studies' correlation equations.) Although the District appears to have predicted emissions rates for each component, the draft HLS report appears to be missing this validation check. We ask the District to provide in the HLS report the correlation equations used to estimate the mass emissions rates from screening values, provide the estimated mass emissions rates, and do the validation check."

Response: "As noted in WSPA's comment above, the Study did not adjust for scale transformation error directly but did so through simulation. Therefore, there are no direct correlation equations to use directly for comparison. However, the Air District did enter the bagging data set within the same approach as used for the field data set and compared the estimated mass emissions results with those that were measured. Appendix D-1 of the report was revised to include new Section III.iii.1 (Validation Check), which describes this validation."

Comment: "Please provide the table of mass emissions rates that were calculated for the screening values in the valve/connector category that were used to calculate the average emission factor for valves."

Response: The comment appears not to understand how the average emission rates were estimated. There was no single table of mass emission rates. Rather there were 10,000 tables where the median value from each simulation run was taken. The average emission rate was then the median value of the 10,000 arrays of median values.

Comment: “At the bottom of page 192, there is a statement that “Using the regression estimates and cumulative probability theory (see Appendix D-1 for a detailed analysis), a cumulative distribution of the maximum emissions by component type was derived and shown in Figure III.66.” It is unclear what is meant by “maximum emissions by component type”—i.e., does it mean maximum measured in this particular study? The subsequent statements that “there is a 70 percent chance of one of the petroleum refineries’ connectors leaking more than 0.1 kg/hour and a 40 percent chance of the maximum being greater than 0.2 kg/hour” and “For valves, there is a close to 50 percent chance of leaking more than 0.1 kg/hour and a 20 percent chance of leaking more than 0.2 kg/hour” are also unclear. On the face of it, these seem to be substantially different from the other study results (i.e., if there was really this much leakage, the average emission factors would be orders of magnitude higher). If what was instead meant was e.g. that “at a given refinery, there is a 70 percent chance of at least one connector leaking 0.1 kg/hour”, the sentence should be worded that way.”

Response: The referenced text is intended to be interpreted literally - "maximum emissions by component type" - and not as measured in the study. The paragraphs that come after the text state "[t]o understand whether screening results may be biased because of missing large leakers...".

The intent of the section is to discuss the probability that the Study did not include one or more large leakers that may exist within the population. As noted in the comment, if such a leaker were included, "the average emission factors would be orders of magnitude higher".

Comment: “Page 235 mentions “eight different regression scenarios” but does not identify what those scenarios are, or why they were chosen. It should include the description of the scenarios from page D-1-25 and provide an explanation of why these eight scenarios were chosen. There was a lot of discussion about this topic and yet there seems to be no information in the Report about it; there should be, as this was an interesting topic that might be of some relevance to future studies. One key reason those scenarios were developed was that there appeared to be a substantive difference between emissions rates measured by the District’s bagging team and emission rates measured by Tricord, with the former being lower. This was analyzed by the District in Spring 2017 and by others in 2018-19, yet we could not discern a reason for the difference, or assess which sampling crew was likely to be getting the more correct result. Accordingly, when assessing how to deal with duplicate samples taken on the same component, the question arose as to whether to disregard all of the District’s sampling entirely (scenarios #3, 4, 7, and 8) or to simply take the first result, whether the District took the data or Tricord did (scenarios #2 and #6). WSPA was against double-counting a component just because multiple samples were taken from it, and so never agreed to scenarios #1 and 5. The other key reason those scenarios were developed was that WSPA had pointed out that the data in the 0-10 ppm range were pretty imprecise (as were many of the results for the 10 ppm cal gas), so it might not make sense for those data to be influencing the regression lines as much as the higher data. So scenarios #1-4 were for linear regression across the full range of data, and #5-8 were for linear regression across just the screening values of 10 ppm and higher. We believe it is more justifiable to make a consistent decision. It appears that the District may have chosen different scenarios for pumps versus other components, and made that choice based on statistical correlation parameters.”

Response: The report was revised to include the referenced description of the scenarios as well as a discussion concerning the rationale for the scenario chosen and used in determining average emission factors.

Comment: “The District goes through several comparisons of its log-space regression equations with those of the 1980 study – which nobody has been using the regression equations from –and then declines to compare to the regression equations in the 1993 API study (which is also the backbone for the correlation equations in the 1995 EPA Protocol and 1999 CAPCOA guidelines) because “because the intent of the 1993 Refinery Study was to derive new correlation equations rather than average emissions, a random sampling of components was not done. Rather, components within given screening ranges were located and then sampled. Therefore, the 1993 Refinery Study screening results would not be a representative sample as a comparison to those found in the Heavy Liquids Study.” That is a completely wrong conclusion. The 1993 API study did the exact same thing that was done in this study: i.e., bagging was done across components based on their screening values (non-random) so that data would be useful for generating correlation equations. This is the reason for the “prioritization” table on page 31 of the November 2017 version of the District’s HLS protocol. The District should make the comparison.”

Response: How data was obtained from the 1993 Refinery Study differed from that obtained in both the 1980 Study and the Heavy Liquids Study. The 1993 Refinery Study included components that handled gas, light liquid, and heavy liquid service while the Heavy Liquid Study did not.

The 1993 Refinery Study did not develop average emission factors for heavy liquid service components while the 1980 Study did.

The premise of the Heavy Liquids Study was that the emissions estimated using the 1980 Study average emission factors may no longer represent existing emissions. Therefore, a comparison with the 1980 regression equations is appropriate while a comparison with the 1993 Study is not.

Comment: “Page D-1-32 states without explanation that “The distribution of y = log (leak rate) has been demonstrated to not be normal and thus the same approach used in the 1980 EPA Study is not appropriate.” The 1980 EPA Study did not use a straight lognormal assumption but instead used “a mixed distribution, specifically a lognormal distribution with a discrete probability mass at zero”.

Response: Appendix D-1 was revised to address this comment.
